

Two Boeing X-45A Unmanned Jets Continue Coordinated Flights

December 14 2004

Two military jets flying together may seem routine, but when they are pilotless, tail-less aircraft, routine goes out the window and science fiction springs to mind. Boeing continued to turn science fiction into reality when two X-45A technology demonstrator aircraft made their second and third coordinated flights at NASA's Dryden Flight Research Center, Edwards Air Force Base, Calif.

Controlled by a single pilot-operator, the Joint Unmanned Combat Air Systems' (J-UCAS) X-45As, complete with Boeing's latest software build known as Block 3 software, departed in succession and entered coordinated flight over the test range. Known by the call signs "Stingray 01 and 02," the revolutionary aircraft operated together in coordinated

flight for more than one hour. During the Dec. 3 mission, the 27-footlong air vehicles flew successfully in several different formations, demonstrating the ability to autonomously enter and exit coordinated flight based on pre-identified points and showing the ability to dynamically alter the formation in all three axes simultaneously.

The previous Block 3 multiple vehicle flight on Nov. 12 demonstrated "4-D" navigation, which allows the vehicles to accurately control time-of-arrival over specified geographic locations in addition to maintaining relative position – a critical capability in tactical operations.

"With 42 flights and more than two years of testing under our belts, we're ready to take unmanned systems to the next level," said Darryl Davis, Boeing J-UCAS X-45 vice president and program manager. "Using data from our first coordinated flight in August and others in 2004, we're developing an affordable, effective war fighting system capable of operating autonomously and cooperatively within networked combat environments."

Boeing was recently awarded \$767 million in funding from the Defense Advanced Research Projects Agency (DARPA) to build and demonstrate three X-45C aircraft, two mission control elements, and to integrate a common operating system technology for the J-UCAS program. Boeing's software used on the X-45As may be offered as a candidate for functionality in J-UCAS' Common Operating System. The first X-45C flight is scheduled to take place in early 2007.

The J-UCAS X-45 program is a DARPA/U.S. Air Force/U.S. Navy/Boeing effort to demonstrate the technical feasibility, military utility and operational value of an unmanned air combat system for the Air Force and the Navy. Operational missions for the services may include suppression of enemy air defenses; strike; electronic attack; intelligence, surveillance and reconnaissance; and persistent global

attack. The two X-45A technology demonstrators are currently verifying the core functionality of the software necessary for these and related missions.

A unit of The Boeing Company, Integrated Defense Systems is one of the world's largest space and defense businesses. Headquartered in St. Louis, Boeing Integrated Defense Systems is a \$27 billion business. It provides network-centric systems solutions to its global military, government and commercial customers. It is a leading provider of intelligence, surveillance and reconnaissance systems; the world's largest military aircraft manufacturer; the world's largest satellite manufacturer and a leading provider of space-based communications; the primary systems integrator for U.S. missile defense and Department of Homeland Security; NASA's largest contractor; and a global leader in launch services.
