

# Birdwatching goes hi-tech with online video camera game

April 19 2007

---

Fans of massive multi-player online games who are also interested in nature will soon get a chance to try out a new system developed by researchers at the University of California, Berkeley, and Texas A&M University.

The new online game, to be launched Monday, April 23, will allow players to earn points by taking live photos using a remotely controllable

robotic video camera and classifying the wild birds they see.

Craig Newmark, founder and customer service representative of craigslist, one of the most popular online communities in the country, is hosting the robotic video camera project from the back deck of his home, which overlooks Sutro Forest in San Francisco.

"This is a new kind of massive multi-player online game," said Ken Goldberg, a UC Berkeley professor of engineering and co-principal investigator of the project. "Rather than aiming a gun at virtual enemies, players aim a camera at live wild birds."

The technology behind the game, called Collaborative Observatories for Natural Environments-Sutro Forest (CONE Sutro Forest), was conceived by Goldberg and Dezhen Song, assistant professor of computer science at Texas A&M.

With funding from the National Science Foundation, Goldberg, Song and their students have been working for several years on systems that allow "collaborative control" of a camera's movements by multiple users over the Internet.

"CONE Sutro Forest uses a collaborative control interface that allows dozens of people to simultaneously share remote control of the pan-tilt-zoom video camera," said Goldberg. "It introduces highly responsive algorithms that automatically compute the optimal camera viewpoint to satisfy dozens of simultaneous players, including experts and amateurs. We've also included a new relay server to make the video stream faster and more responsive, a database of images and biological information about the wild birds likely to be spotted in the Sutro Forest, and a scoring system that rewards users who find and identify unusual birds."

For instance, using a computer mouse, a registered user of the Web site

may direct the camera to point at a bluejay and snap a photo. However, if a majority of other players direct the camera elsewhere, the system will favor the more popular choice.

Players can see who else is logged on and try to beat them to the best pictures. The system waits until the photo is classified consistently by at least two players, and assigns points according to how rare the bird is. Players with higher scores get more influence over where the video camera is positioned.

"We hope this project increases public awareness about how technology can help natural observation," said Song. "This also brings people with a specific knowledge together effectively and efficiently."

"This is an interesting experiment in collaborative technology," added Newmark. "It's also fun to see an educational game based on what's happening outside my window."

"We're hoping it attracts a wide range of players, from young video gamers who have never tried birdwatching, to seniors who are seasoned birdwatchers," said Goldberg. "Initially, the gamers may be better at controlling the interface, and birdwatchers may be better at correctly classifying the birds. We're looking forward to seeing how things turn out."

Starting April 23, CONE Sutro Forest will be free and open to the public at: [cone.berkeley.edu](http://cone.berkeley.edu) .
