

# Climate change aims need to be better integrated

March 26 2009

---

This is the cover of the new PEER report Credit: PEER

Specific measures to tackle climate change, such as emissions trading, will only be successful if they are coherently supported by other government policies addressing economic and social issues, says a report published today by the Partnership for European Environmental Research (PEER). PEER membership is formed from seven of the biggest European environmental research institutes.

The report explains that, in order to create an effective, Europe wide [climate policy](#), [climate change](#) issues must be better integrated into both

general and sector-specific policies such as taxation, transportation, and land use planning. By doing this the necessary changes in production processes and consumption patterns to tackle climate change will be achieved.

Lead author, Dr. Per Mickwitz, from the Finnish Environment Institute (SYKE), said, "Although the inclusion of [climate change mitigation](#) and adaptation in general governmental programmes and strategies has substantially increased in recent years, much more is needed in terms of integrating [climate issues](#) into specific policy measures. Annual budgets, environmental impact assessments and spatial planning procedures are three examples of existing measures which we believe have significant potential to be climate policy instruments."

The new report assesses the degree of climate [policy integration](#) in six different European countries, at national and local levels, as well as within key policy sectors such as energy and transport. It analyses measures and means to enhance climate policy integration and improve policy coherence.

The report shows that when climate policy is integrated into an increasing number of policy sectors such as energy, transport and land use, many latent conflicts are reopened. These include conflicts over nuclear power, taxation, [hydro power](#), mobility and other issues involving values and ideology. If such conflicts are not recognised early they provide a barrier to effective climate policy integration.

Professor Pat Nuttall, Director, Centre for Ecology & Hydrology, UK, said, "As PEER chair, I know how important it is to work together within Europe to ensure that future decisions will be based on the best information available, minimizing risks and, in some cases, turning threats into opportunities. There is a huge need for increased policy and programme evaluation from a climate change perspective, and this

report is a first step towards achieving this goal."

Over recent decades, climate change research has focused primarily on the climate system impacts in general terms, and on mitigation. In the future, new challenges will be posed by the emergence of climate change adaptation policies across Europe. Climate policy integration and coherence will be essential in order to bring together the environmental, economic and social impacts of both adaptation and mitigation policies.

A second report from PEER, comparing National Adaptation Strategies to climate change across Europe, will be published in May 2009.
