

Gender, geography influence floral purchases

March 25 2009

Scientific studies of "consumption value" explore the reasons consumers choose particular products and provide marketers with ways to analyze consumer behavior and influence purchasing. Studying the value of consumption is believed to have diagnostic value in the analysis of consumer choice behavior and, therefore, is helpful in improving the efficiency of the market. To enhance efficiency and promotion, it is essential for marketers to know the consumption value that buyers place on products.

Tzu-Fang Yeh and Li-Chun Huang from Da-Yeh University in Changhua, Taiwan, and National Taiwan University, Taipei, Taiwan, recently published a research report in the American Society of Horticultural Science journal *HortTechnology*. The study's objective was to identify the [consumption](#) value that [consumers](#) seek from floral products, while clarifying the context of these values.

Men and women from three main cities in Taiwan were sampled to represent a population living an urban lifestyle. To compare differences in the [consumption values](#), both genders of consumers from rural areas also participated in the survey. From a consumer survey of 33 questions, 644 valid questionnaires were analyzed.

The researchers discovered that "the statistical results of the analysis revealed that sensory hedonics, [emotion conditioning](#), [curiosity fulfillment](#), monetary worth, and showing care to others were the main types of the consumption values related to floral products."

"Sensory hedonics", a phenomenon in which consumers perceive the value of [flowers](#) based on touching, smelling, or tasting them, was analyzed using questions such as: "touching flowers can lift up my spirit," "the smell of flowers makes me feel good," and, "I enjoy food with flowers in the recipe."

The second value, termed "emotional conditioning" was indicated through participants' responses to questions such as: "flowers give me a feeling of peace," and "flowers make me feel happy." This value illustrates the interaction between the consumer's mind and flowers; it describes the emotional side of flower consumption. For instance, flowers can condition the consumer's mind or spirit, and make the consumer feel happy, good, and joyful.

Different consumer groups tended to rate as more important diverse floral consumption values. Female consumers rated values like emotion conditioning and curiosity fulfillment as stronger influences on their purchasing, while male consumers were more likely to make choices based on sensory hedonics. Consumers from rural areas showed a stronger demand for the values of curiosity fulfillment and monetary worth, while urban consumers favored emotion conditioning values when choosing flowers.

Armed with information about values like sensory hedonics and emotion conditioning and their related importance to consumers, florists can create more effective marketing strategies.

"The implication is that flowers should be marketed to provoke the sensory pleasures of vision, olfaction, and/or texture. Such value adding helps to shape positive experiences, leading to the purchase or use of flowers by consumers", conclude Huang and Yeh.
