

NASA, NOAA Ready GOES-P Satellite for March 2 Launch

February 23 2010

The Geostationary Operational Environmental Satellite-P, or GOES-P, is scheduled for launch aboard a Delta IV rocket on Tuesday, March 2, from Cape Canaveral Air Force Station in Florida. The one-hour launch window extends from 6:19 to 7:19 p.m. EST.

GOES-P will provide expanded capability for space and solar environment-monitoring instruments. The satellite will enhance forecasts and warnings for solar disturbances. GOES-P data will help protect billions of dollars in investments by the government and private sector for assets on the ground and in space.

GOES-P will feature a highly stable pointing platform that will improve the performance of its Imager and Sounder, instruments used for creating daily weather-prediction models and hurricane forecasting. Data from GOES-P will be valuable for the National Oceanic and Atmospheric Administration's National Ocean Service, which provides oceanographic circulation models and forecasts for U.S. coastal communities.

As with all of NOAA's geostationary and polar-orbiting weather satellites, GOES-P will be able to relay distress signals detected from emergency locator beacons on the ground and at sea in support of the international search and rescue system. NASA's Goddard Space Flight Center in Greenbelt, Md., was responsible for designing and developing the spacecraft and its instruments for NOAA.

GOES-P is the last of three in the series of geostationary weather and environmental satellites built for NASA by Boeing Space and Intelligence Systems. The spacecraft will be checked out by Goddard and Boeing before being turned over to NOAA for operational use.
