

Startup lets webcams detect people

February 8 2010

Vitamin D Video on Monday released a finished version of software that detects people in surveillance footage recorded by common Web cameras.

Vitamin D Video on Monday released a finished version of software that detects people in surveillance footage recorded by common Web cameras.

While using "webcams" to keep watch is nothing new, the California-based start-up has eliminated the need to sift through hours or days of video for portions containing folks whose activities or lack thereof may be of interest.

Surveillance [webcam](#) software that detected motion routinely vexed users with emails or alerts triggered by any motion, be it a passing bird or swaying branch. Vitamin D is crafted to recognize people.

"Say goodbye to the dark ages of video analytics," Vitamin D said at its website. "Our approach to object recognition paves the way for powerful new applications in security, advertising, entertainment and video search."

Vitamin D said it uses [artificial intelligence](#) to help computers discern between objects such as clouds, planes, and people in a way similar to how the human brain processes [visual information](#).

The company was founded in 2007 by former Palm employees.

Vitamin D [Video](#) 1.0 software was released on Monday, marking the end of a public test phase. A starter edition configured to work with one camera per computer is free.

A version supporting two cameras per computer is priced at 49 dollars (US) and a Pro Edition with no limit on the number of webcams has a 199-dollar price tag.
