

Thousands of dinosaur footprints uncovered in China

February 7 2010

A mound strewn with dinosaur bones is seen October 2009 in Zhucheng, in northeast China's Shandong province. Paleontologists in China have uncovered more than 3,000 dinosaur footprints, state media reported, in an area said to be the world's largest grouping of fossilised bones belonging to the ancient animals.

Archaeologists in China have uncovered more than 3,000 dinosaur footprints, state media reported, in an area said to be the world's largest grouping of fossilised bones belonging to the ancient animals.

The [footprints](#), believed to be more than 100 million years old, were discovered after a three-month excavation at a gully in Zhucheng in the eastern province of Shandong, the Xinhua news agency reported.

The prints range from 10 to 80 centimetres (four to 32 inches) in length, and belonged to at least six different kinds of dinosaurs, including

tyrannosaurs, the report said Saturday.

Wang Haijun, a senior engineer at the Chinese Academy of Sciences, said the prints faced the same direction, Xinhua said.

This indicated a possible migration or a panic escape by plant-eating dinosaurs after an attack by predators, Wang added.

Archeologists have found dinosaur fossils at some 30 sites in Zhucheng, known as "dinosaur city."

The region has seen two major digs since 1964, and experts say the discovery of so many [dinosaurs](#) in such a dense area could provide clues on how the animals became extinct millions of years ago.

Plans are being made to set up a fossil park in the area.
