

# Consumer Reports faults iPhone 4 antenna in test

July 12 2010, By JESSICA MINTZ , AP Technology Writer

---

The new iPhone 4. Consumer Reports, the influential magazine for product reviews, gave the thumb's down Monday to Apple's new iPhone because of reception problems it said were caused by a design flaw.

Consumer Reports said Monday it will not recommend Apple Inc.'s newest iPhone because of reception problems caused by its antenna design.

After the [iPhone](#) 4 went on sale in June, buyers started complaining that holding the gadget a certain way could cause reception to fade and calls to drop.

[Apple](#) has said that any phone will lose signal strength when gripped in certain ways. It said the iPhone 4 seems to show a larger drop because it has been using a faulty formula to decide how many signal bars to show.

But Consumer Reports said it tested several phones that use AT&T Inc.'s network, and only the iPhone 4 seemed to have the reception issue.

"Our findings call into question the recent claim by Apple that the iPhone 4's [signal-strength](#) issues were largely an optical illusion caused by faulty software," Mike Gikas of Consumer Reports wrote in a blog post Monday. "The tests also indicate that AT&T's network might not be the primary suspect in the iPhone 4's much-reported signal woes."

Apple did not respond to messages seeking comment.

The iPhone 4 topped Consumer Reports' updated ratings list for smart phones, thanks to its sharp display and "best video camera we've seen on any phone," according to the blog. But the magazine, which tests electronics, appliances and other items, will not mark the iPhone 4 recommended until Apple finds a permanent and free fix for the problem.
