

Solar tunnel powers part of Paris-Amsterdam train line

June 6 2011

Workers install solar panels for the Hybrid solar lighting (HSL) tunnel in Brasschaat, Belgium in 2010. High-speed international trains linking Paris and Amsterdam became the first in Europe to use electricity generated by solar panels installed in a tunnel on the line.

High-speed international trains linking Paris and Amsterdam as of Monday became the first in Europe to use electricity generated by solar panels installed in a tunnel on the line.

At a cost of 15.6 million euros, project managers say the 3.6-kilometre tunnel crossing Antwerp, in northern Belgium, is fitted with 16,000 solar panels covering 50,000 square metres, roughly eight football pitches.

The panels produce 3,300 <u>megawatts</u> per hour of electricity, or the average annual consumption of nearly 1,000 families.

The first "green train" left Antwerp on Monday for the Dutch border. While it was filled as usual with commuters and students, for a dozen or so kilometres, its engines plugged into the solar energy source fitted along the line.

The electricity produced feeds into the line's infrastructure, for lighting, signals and in-train power points, said Frederic Sacre, spokesman for Infrabel, which runs the rail network.

"By using electricity generated on-site, we eliminate <u>energy losses</u> and transport costs," said Steven De Tollenaere, head of project developers Enfinity, which leans on state subsidies backing <u>energy use</u> that meets clean climate goals.

The company hopes the project will allow it to develop new installations in the United States and other parts of the world, citing train hangars as ideal sites for such charging points in the future.
