

# Death from above: Parasite wasps attacking ants from the air filmed for the first time

August 29 2011

---

A female parasitoid wasp of *Kollasmosoma sentum* new species attacks an ant worker of *Cataglyphis ibericus*; all in 0.05 seconds. Credit: José María Gómez Durán

Flight attacks of small parasitoid wasps (no larger than 2.0 mm in size) on ant workers have been filmed by José María Gómez Durán from Madrid. The four species of wasps show amazing adaptations and enormous differences in the tactics they use. Two of the four filmed species are new to science and are described by Dr Kees van Achterberg from NCB Naturalis Leiden.

The study was published in the open access journal *ZooKeys*.

[Ants](#) are a very dominant group in nature and well-equipped to defend themselves. Only a few small parasitoids manage to break through their defence, thanks to very different and amazing adaptations. The four

filmed species belong to four different genera and two different families of [wasps](#) (*Braconidae* and *Ichneumonidae*). The eggs of the *Braconidae* develop inside adult ants. The eggs of the *Ichneumonidae*, however, develop in the larvae of ants. How the newly developed young wasps manage to survive inside the ant nest is still unknown. One of the possible explanations is that dead ants may be deposited outside the entrance of the ant nest, thus giving the young wasps a chance to emerge, avoiding a lethal attack on themselves.
