

iPhone 4S first phone for low-power Bluetooth

October 24 2011, By PETER SVENSSON , AP Technology Writer

The iPhone 4S has a little-heralded feature that makes it unique among phones, at least for a while: It can talk to a new class of wireless devices, such as watches and glucose and heart-rate monitors.

The phone, which went on sale Oct. 14, is the first one to have a new type of Bluetooth chip that can connect using very little power. The chip uses so little power that it can go into devices that are powered only by a standard "button cell" or watch battery.

The industry group behind Bluetooth on Monday said these small devices will be labeled "Bluetooth Smart." More fully-featured devices like the [iPhone](#) that can communicate with them and with other, standard Bluetooth devices will be labeled "[Bluetooth](#) Smart Ready."
