

Africa pitches new promised land for astronomers

December 19 2011, by Claudine Renaud

The Karoo Array Telescope construction site, part of the MeerKAT Project, in the Northern Cape. South Africa wants to draw leading astrophysicists to the continent as well with the world's most powerful radio telescope, the Square Kilometre Array.

Africa, the birthplace of the human species, has long been a magnet for archaeologists.

Now South Africa wants to draw leading astrophysicists to the continent as well with the world's most powerful radio telescope, the [Square Kilometre Array](#) (SKA), an instrument that would be able to look back to the infancy of the universe.

South Africa and Australia are the two finalists in the competition to host the project, which will eventually link thousands of radio dishes to

make a massive antenna with a total surface area of one square kilometre (250 acres).

The telescope, the brainchild of an international consortium of scientists, will be 50 to 100 times more sensitive than today's best [radio telescopes](#) and is projected to cost in the neighbourhood of \$2.0 billion (1.5 billion euros).

Like an archaeologist digging into ever deeper layers of soil, the telescope will pick up [radio waves](#) from deeper in space than ever before, ones whose sources are billions of years old and may not even exist anymore.

Scientists say that power will help them look back in time and see how the universe took shape after the big bang.

For African astronomers, next year will be decisive.

An artist impression of low frequency aperture arrays of the Square Kilometre Array. South Africa is well-placed to host the world's largest telescope because it would cost cheaper, according to the deputy science minister.

Scientists will decide by early March whether the South African and

Australian SKA site proposals pass muster. The consortium will then choose the winner, a decision the South Africans say will be political and economic as well as scientific.

South Africa also plans to start construction next year on a 64-antenna radio telescope called MeerKAT that would be one of the five most accurate in the world.

Observation slots at the MeerKAT are already fully booked for its first five years.

A prototype, the KAT-7, is up and running in the Karoo, an arid expanse of sparsely inhabited land stretched across the country's western side.

The government has declared the site, a silent, rocky landscape that looks like a Western movie cast with a few sheep, a "[Radio Astronomy Reserve](#)".

The site, which had no trace of human settlement eight years ago, is an hour by road from the nearest town, itself an hour's flight from Cape Town. Like giant white saucers turned to the sky, seven dish antennas capture the noise of the universe with a small, refrigerator-like hum.

"It is a very difficult place to do farming," said Justin Jonas, an astronomer and engineer and the operating director for SKA Africa.

"Which is good for us. It means the fewest people, fewest cell phones and fewest interferences."

South Africa's SKA bid would also put the core of antennas in the Karoo.

Other antennas would be scattered around the continent in Ghana,

Kenya, Madagascar, Mauritius, Mozambique, Namibia and Zambia.

Design and pre-construction on the SKA are scheduled to begin in 2013. The project is expected to be finished around 2024.

It is not an ideal time to be raising money for massive science projects. The US pulled out of the SKA last year, leaving it to Australia, Britain, China, Canada, Italy, New Zealand, the Netherlands and South Africa to fund. India is still on the fence.

But South Africa is undeterred. It says it can build the SKA for less money than Australia, which would co-host with New Zealand.

The government has already invested 635 million rand (\$75 million) in seven years to build MeerKAT and plans to spend another 500 million rand a year to 2016.

"With a project like this, you don't make money, but you get a lot more. You develop scientific capacity," said Nadeem Oozeer, 36, a researcher

from Mauritius.

"In Mauritius, we've got five graduates with terminal (doctorate) degrees. Why not an African Nobel prize winner?"

But officials here say they have to overcome negative perceptions of Africa's scientific potential.

"Afro-pessimism is real," said Derek Hanekom, deputy science minister.

"We believe we are the most suitable country to host successfully the SKA, we compete with the best in the world. But we are proceeding anyway and great astronomy is going to be done with or without the SKA."
