

Indonesia land clearance 'wiping out' orangutans

March 28 2012

Critically-endangered orangutans in a protected area of Indonesia will be wiped out by the end of the year if land clearing is not stopped, a coalition of environmental groups warned.

Critically-endangered orangutans in a protected area of Indonesia will be wiped out by the end of the year if land clearing is not stopped, a coalition of environmental groups warned Wednesday.

The government must immediately halt the clearance of forest in the 13,000-hectare (32,000 acres) peat swamps in Tripa, Aceh province, the groups, including [Greenpeace](#) and Friends of the Earth said.

They also called on the government to investigate the use of fire by palm [oil companies](#) for land clearing and reinforce existing laws protecting the ecosystem.

Ian Singleton, conservation director of Swiss-based PanEco, one of the groups making up the Coalition for Protection of Tripa Swamp, said the roughly 200 orangutans left in the peat swamps will be gone in months if the fires continue.

"The speed of destruction, fires, burning and everything has gone up dramatically in the last few weeks, let alone in the last year, and this is obviously a deliberate drive by these companies to clear all the remaining forests," he said.

"If this is not stopped right now, then all those orangutans, all those forests, will be gone before the end of 2012."

Experts believe there are about 50,000 to 60,000 of the two species of orangutans left in the wild, 80 percent of them in Indonesia and the rest in Malaysia.

They are faced with extinction from poaching and the rapid destruction of their [forest habitat](#), driven largely by palm oil and paper plantations.

Most of those left are the endangered Bornean orangutan species. And Singleton said that based on 2004 figures there are only 6,600 of the critically-endangered Sumatran orangutans left in North Sumatra and Aceh provinces.

"We suspect that up to 100 orangutans may have perished in forest clearing and peat burning in the last few months in Tripa," said Graham Usher of local group Foundation of a Sustainable Ecosystem.

Satellite monitoring found at least 87 fire hotspots between March 19 and 24 in three palm oil concessions. Footage and images captured large clouds of white smoke and patches of burnt peat.

At least 2,800 hectares of peat were destroyed in the latest fires, and the number of animals, including Sumatran [orangutans](#), Malayan sun bears and Sumatran tigers that perished was "immeasurable", the local group added.

[Palm oil](#) is a key ingredient in soap and everyday foods ranging from peanut butter to sweets but its cultivation is considered one of the biggest threats to the world's dwindling rainforests.
