

Mars rover Curiosity working 'flawlessly': NASA

September 13 2012

This view of the lower front and underbelly areas of NASA's Mars rover Curiosity was taken by the rover's camera on September 9. Curiosity rover, which landed on Mars more than a month ago, appears to be working "flawlessly" as it prepares to continue its two-year exploration of the Red Planet, said the US space agency.

For the past week, the rover, which touched down on August 6, has undergone a [series of instrument tests](#), as well as a rebooting of its steering computers, and everything so far appears fine, according to officials with the Jet Propulsion Laboratory in Pasadena, California.

"Through every phase of the check-out, Curiosity has performed almost flawlessly," said Jennifer Tropsner, mission manager for Curiosity at the

laboratory, adding that a final few tests would be done early Thursday.

"The success so far of these activities has been outstanding," she told reporters in a telephone briefing.

Curiosity is on a mission to investigate whether it is possible to live on Mars and to learn whether conditions there might have been able to support life in the past.

The rover last week temporarily halted its journey across the surface of Mars as it tested the tools on its [robotic arm](#).

The goal was to figure out how the arm is functioning after the long [space voyage](#) and in the different gravity and temperatures on Mars.

The arm and the soil sampling system are the last pieces of the massive rover to be put through testing, officials said.

The \$2.5 billion craft has covered some 109 meters (357 feet) within the Gale crater since it began trundling eastward en route to its first major destination—an intersection called Glenelg.

That site, located at a meeting point of three different types of terrain, is where [NASA](#) experts hope to find a first rock target for drilling and analysis.

Space officials have said it will be a few more weeks before the rover is in place and ready to scoop up a sample of [Martian soil](#).

After Glenelg, [Curiosity](#) will continue on to its ultimate destination, the slopes of nearby Mount Sharp.
