

Saber-toothed cat fossils found near Las Vegas

December 16 2012

Researchers say a pair of fossils unearthed in the hills north of Las Vegas belonged to a saber-toothed cat.

The Las Vegas Review-Journal reports a team from California's San Bernardino County Museum identified the fossils dug up in June as being front [leg bones](#) from the extinct predator.

Kathleen Springer, the museum's senior curator, says the saber-tooth fossils are thought to be approximately 15,590 years old.

The discovery marks the first of its kind in the [fossil](#)-rich Upper Las Vegas Wash. Springer heads a team that's been studying the wash for a decade and been collecting fossils there under a contract with the U.S. [Bureau of Land Management](#) since 2008.

She says the bones of Las Vegas' only known saber-toothed cat are still being studied. There are no immediate plans to display them, but Springer expects that to happen eventually.
