

Driverless, networked cars on Ann Arbor roads by 2021

November 11 2013, by Nicole Casal Moore

(Phys.org) —By 2021, Ann Arbor could become the first American city with a shared fleet of networked, driverless vehicles. That's the goal of the Mobility Transformation Center, a cross-campus University of Michigan initiative that also involves government and industry representatives.

"Ann Arbor will be seen as the leader in 21st century mobility," said Peter Sweatman, director of the U-M Transportation Research Institute. "We want to demonstrate fully driverless vehicles operating within the whole infrastructure of the city within an eight-year timeline and to show that these can be safe, effective and commercially successful."

Autonomous vehicles could change how people and goods move around in a way that the auto industry hasn't seen since its inception, researchers say.

"We've now entered into a period where the technology and the business models are coming together to allow us to break out of this 100-year dependence on what we've always known," said Larry Burns, a professor of practice at Michigan Engineering and former head of research and development for General Motors.

For self-driving vehicles to bring this revolution, though, they have to be at the center of a reimagined transportation system in which vehicles are networked and shared. Simply replacing conventional models with driverless ones won't achieve the maximum benefits, Burns says.

Through the Mobility Transformation Center, U-M is working toward this goal.

Researchers are in the midst of the nation's largest street-level connected [vehicle](#) experiment, called Safety Pilot, which involves some 3,000 area residents in networked vehicles. And in October, U-M regents approved plans for a one-of-a-kind driverless car test environment near North Campus. The 30-acre, \$6.5 million facility—a joint project with industry and government—will simulate a dynamic cityscape where researchers can test how the vehicles perform in complex urban settings.
