

# Peru probes killing of endangered penguins

April 22 2014

---

Two Humboldt penguins swim at the Aurora zoo on May 6, 2013 in Guatemala City

Peruvian authorities announced an investigation Tuesday into the killing of five penguins found slashed to death at a center for endangered species.

The remains of the rare Humboldt penguins—two adults and three pups—were scattered in two bloody pools of water.

Prosecutor Karin Padilla told reporters the youngest of the slain pups was just eight months old and that the carcasses showed their throats had been slashed.

The killings reduced the number of Humboldt penguins at the rescue and breeding center in Puerto Eten, on Peru's northern coast, to 16.

Humboldt penguins are a species of [flightless birds](#) that breed along the Chilean and Peruvian coasts, where they are believed to number no more than 50,000.

Each year, hundreds of these penguins get caught in [fishing nets](#).

They are also threatened by the El Nino climate phenomenon, which occurs every two to seven years when the prevailing [trade winds](#) that circulate surface water in the tropical Pacific start to weaken.
