

# **Lockheed Martin advances live, virtual, constructive training in flight test**

September 16 2014

---

Lockheed Martin has taken another step forward in live, virtual and constructive (LVC) training during a flight demonstration at the company's Aeronautics facility in Fort Worth, Texas. Integrating live, virtual and constructive elements is essential to train pilots for complex challenges that simply cannot be replicated in a live environment. It enables the warfighter to train as they would in a real-life combat situation – with ground, air and maritime assets fully integrated.

During the flight test, a pilot flying in a live F-16 engaged in a synthetic training exercise with a pilot flying as wingman in a ground-based F-16 simulator. Simulated sensor data sent from the ground into the aircraft provided a shared constructive training scenario for the live and virtual aircraft. The two F-16s cooperated to engage multiple simulated aggressors and defend against simulated ground surface missile threats in real time.

"LVC is the future of effective training for operational readiness," said Jon Rambeau, vice president for Lockheed Martin's Training and Logistics Solutions business. "As a technology leader, Lockheed Martin is applying innovative solutions to deliver more dynamic training experiences for our customers."

The company's Advanced Combat Enhancement System (ACES) program integrates several technologies for a unique LVC solution to move data between ground and aircraft sensors, helping pilots train with simulators, computer-generated forces and other aircraft in the same

synthetic environment.

This demonstration marks the company's progress towards providing a technical solution that can improve operational readiness while reducing training costs and reliance on airspace or adversary [aircraft](#). Future demonstrations will validate this capability on additional platforms and training scenarios in preparation for integrating LVC into fourth and fifth generation pilot [training](#).
