There are more than 150 species of beetles in the genus *Calathus*, 17 of which have only been found in the mountains of the Ethiopian Highlands. Now scientists have found two new ones—*Calathus juan* and *Calathus carballalae*—and have described them in *Annals of the Entomological Society of America*.

C. juan is named for Juan Novoa, the son of one of the authors, in recognition of his help on various beetle-collecting expeditions. Adults

are black and shiny, and are 9.5-11.5 millimeters long. It was found under stones at the base of giant, tree-like plants called lobelias (*Lobelia rhynchopetalum*) at almost 3,600 meters above sea level.

C. carballalae is named for Regina Carballal, the wife of the first author, also for collaboration on Coleoptera-collecting expeditions. It was found under stones on barren soil nearly 4,150 meters above sea level.
