

Great apes facing 'direct threat' from palm oil farming

November 20 2014, by M Jegathesan

An endangered Sumatran orangutan cradles her baby in the Leuser National Park, but environmental activists fear ape habitats are at risk as huge swathes of forest in Southeast Asia are sold to mining, palm oil and paper companies

The destruction of rainforests in Southeast Asia and increasingly in Africa to make way for palm oil cultivation is a "direct threat" to the survival of great apes such as the orangutan, environmentalists warned Thursday.

They said tropical forests were tumbling at a rapid rate, with [palm plantations](#) a key driver, despite efforts by the industry's Roundtable on Sustainable Palm Oil (RSPO) to encourage sustainable cultivation.

The concerns were voiced at the sidelines of the annual RSPO meeting, held this year in Malaysia and which concluded Thursday.

"Orangutan and ape habitats are being destroyed," said Doug Cress, from the UN Environment Programme's [great ape](#) protection campaign.

"The destruction of rainforest in Southeast Asia and increasingly now in Africa is a direct threat to the great apes."

In Southeast Asia alone, up to one million hectares of forest—nearly the size of Jamaica—is lost annually to agricultural expansion like palm oil, said Adam Harrison, agriculture policy specialist with the WWF.

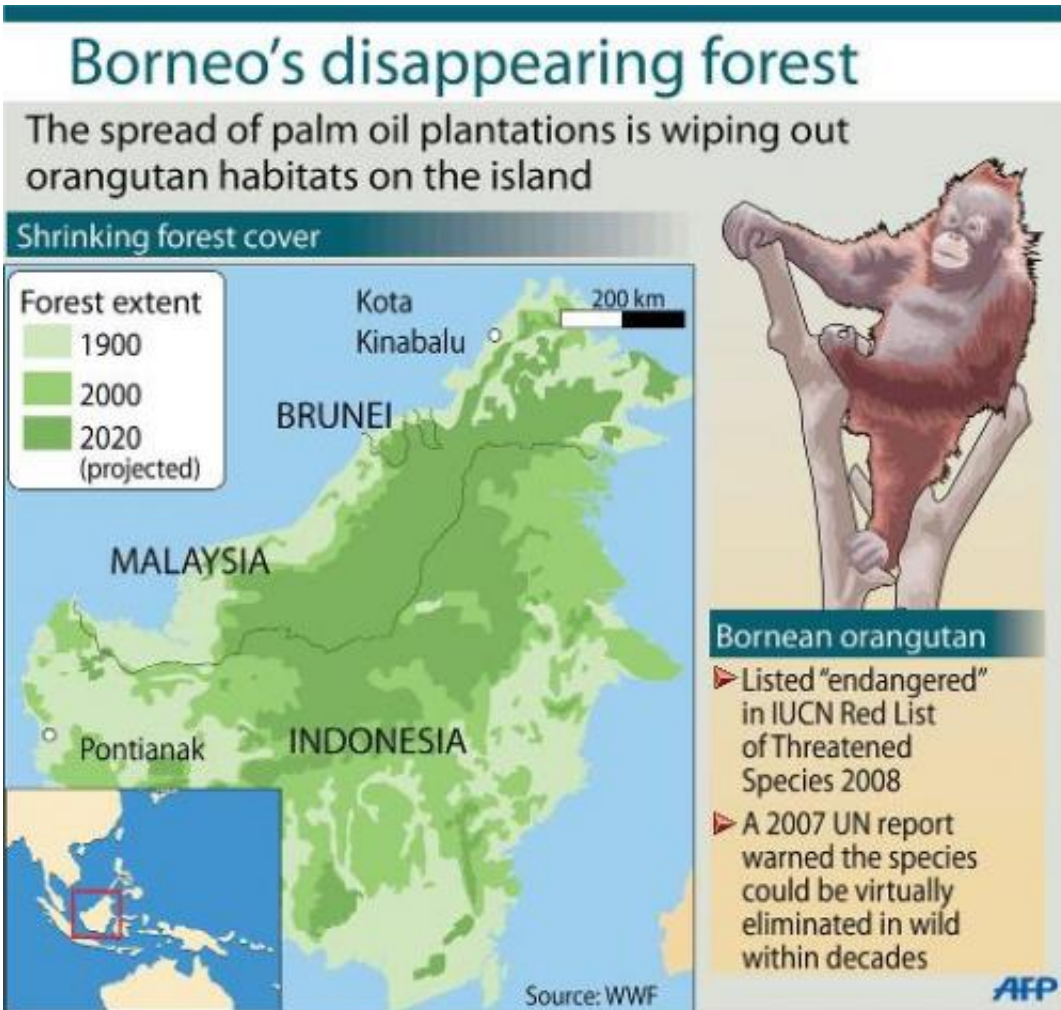

"(Land clearing for plantations) has been high. Some of them are in high-quality forests which will have an impact on climate change," he said.

Habitat destruction

"The orangutans will become extinct within a few decades. In Borneo island we are already seeing that there are only a handful of rhinos left. It is not a viable population and it will go extinct," Harrison added.

Borneo is shared by Malaysia, Indonesia and Brunei.

The problem is most acute in leading palm oil producers Malaysia and Indonesia, which account for 85 percent of world production, conference participants said.

Orangutans are endangered by the spread of palm oil plantations on the island of Borneo, which is shared by Malaysia, Indonesia and Brunei

In Southeast Asia, palm oil is a versatile and cheaply farmed cash crop promoted to eradicate poverty. In return, the growers who live on allocated land become a strong vote bank for the ruling government.

But it is now also a looming threat in even more poorly regulated Africa, where the industry is set to "explode", according to Cress.

Derived from the fruit of the oil palm, its use has skyrocketed in recent

years and it is now a key ingredient in a vast range of every-day products, from lipstick to instant noodles, shampoo and ice cream.

The RSPO, bringing together stakeholders including producers, end-user manufacturers, and environmental groups, was formed in 2004 as concern over the ecological impact of mushrooming palm cultivation took off.

It seeks to promote production that is environmentally sustainable and respects native land rights, but the organisation's efficacy has increasingly been questioned as forest destruction has continued.

Palm plantations, along with other drivers of deforestation, have been

linked to the destruction of habitats critical to endangered species such as orangutan, Asian rhinos and tigers.

Harrison cited as an example Tesso-Nilo National Park in Indonesia, which was set aside as a preserve for tiger and elephant habitats.

In Southeast Asia alone, up to one million hectares of forest is lost annually to agricultural expansion like palm oil plantations, environmental activists warn

"Half of the national park was cleared for [palm oil](#) by small-holders. The small-holders then sold the fruits to RSPO members. This is unacceptable," he said.

Harrison said if deforestation continued at current rates, tiger and elephant populations in Southeast Asia could be wiped out within in a decade.
