

# How 3D printing with biomaterials can minimize our carbon footprint and revolutionize the world

February 6 2015

---

How can 3D Printing revolutionize the world? In the newly published book '[3D Printing with Biomaterials](#)', authors Ad van Wijk and Iris van Wijk explore the promises of 3D printing with biomaterials towards a sustainable and circular economy. This is illustrated by a remarkable example: the printing of an entire town house from bio-based plastics, made from sugar beets. The resulting carbon footprint for material is reduced by more than 60%.

Prof. Dr. Ad van Wijk says: "Truly sustainable and circular products can be realized by 3D printing with [biomaterials](#), and we are determined to explore the synergistic effect of this revolutionizing technology combined with biomaterials."

The book describes two paradigm shifts that will revolutionize the economy: 3D printing and biomaterials. The first shift holds the promise to manufacture on demand, locally and with less waste and energy. It may use a wide range of material types such as metals, ceramics, sand, synthetic materials such as [plastics](#), and even food or living cells. The second shift is that synthetic materials, such as plastics, can be made of different types of biomass such as maize, [sugar beets](#) or even organic waste. These biomaterials can almost completely substitute fossil-based plastics. "The material cycle can be closed by feeding the printer with filament based on biomaterials, such as bio-based plastics. By doing so, we contribute to a sustainable and circular economy," explains Iris van Wijk.

The research is done in The Green Village, in cooperation with Amsterdam University of Applied Sciences (HvA). The Green Village ([www.thegreenvillage.org](http://www.thegreenvillage.org)) is developing on the campus of the Delft University of Technology in the Netherlands, and brings scientists, students and enterprises together to create a sustainable and lively environment where innovative solutions for today's urgent challenges can be found. The Amsterdam University of Applied Sciences (HvA) studies

the application of bio-based plastics in high-value products in the research program Urban Technology.
