The University of Texas System launched a cutting-edge web portal

today that allows private sector and government agencies to quickly find thousands of renowned researchers and facilities at the System's campuses and health institutions.

Influent is a free online searchable database of researchers and resources that enable potential collaborators to easily identify and connect with faculty experts across all departments to conduct all levels of research (basic, applied and clinical), develop new technologies and processes and overcome technical challenges.

The UT System is the first university system of its size in the nation to launch a database with such capabilities. Influent is the gateway to more than 15,000 UT System researchers who have produced nearly 110,000 publications in the last five years in science, medicine, engineering, energy, transportation and business.

"The University of Texas System has research expenditures of nearly \$2.7 billion and a wealth of faculty experts for public- and private-sector organizations to tap into with Influent," said Patricia Hurn, vice chancellor for research and innovation.

Influent's search tool scans and analyzes every publication in Scopus, the largest abstract and citation database of peer-reviewed research literature that's updated weekly. That data is used to produce a fingerprint of each researcher's expertise.

The database is also designed to provide access to not only a faculty researcher, but their entire research ecosystem including their collaborators, specialized facilities and equipment and other faculty in the same academic department.

Influent searches can be based on a keyword, concept, last name or published abstract. Once users have found the right experts, they can

contact them directly. In addition to boosting the state's economy, Influent makes Texas more business-friendly. This powerful tool will also foster cross-institution collaborations among UT researchers from different campuses and institutions.

In a time of limited federal and state funding, universities must actively seek more partnerships with private industry, which is conducting less research and development (R&D) on its own.

"The combination of extraordinary faculty experts and unique research facilities make UT System faculty a clear choice for industrial partnerships to move ideas and innovations forward throughout the world," said Stephanie Bond Huie, vice chancellor for strategic initiatives.

Influent was funded as part of the Innovation Framework approved by the UT System Board of Regents last year.

"When they made this investment, the Regents recognized that supporting the R&D efforts throughout the UT System's institutions is vital to our continuing success," Chancellor William H. McRaven said.

Influent was developed in collaboration with Elsevier, a provider of information solutions for science, health and technology professionals.
