Images from a NASA Mars orbiter's telescopic camera reveal details of real regions on Mars where a new Hollywood movie, "The Martian," places future astronaut adventures.

The novel of the same name used actual locations on Mars for the landing sites for its "Ares 3" and "Ares 4" missions. The landing sites for "Ares 3" is on a Martian plain named Acidalia Planitia. The base for the "Ares 4" mission was set inside a crater named Schiaparelli.

Views of these two sites, and other locations pertinent to the fictional story, are in the latest weekly release of images from the High Resolution Imaging Science Experiment (HiRISE) camera on NASA's Mars Reconnaissance Orbiter. They are available online at: uahirise.org/martian

Each observation by HiRISE covers an area of several square miles and shows details as small as a desk. More than 39,000 of them have been taken since the Mars Reconnaissance Orbiter reached Mars in 2006. They are available online for anyone to explore, from the comfort of home, at: hirise.lpl.arizona.edu

The HiRISE team has an online process through which anyone can register to submit suggestions for sites to be imaged on Mars, at: www.uahirise.org/hiwish
