

A new sensor to detect physiological levels of nitrate and nitrite

December 9 2015

A team led by Professor Takafumi Uchida has created a new technique for visualizing the dynamics of nitrate (NO_3^-) and nitrite (NO_2^-), both markers of nitric oxide in a cell. Nitric oxide is a critical second messenger in the body, playing roles in vascular homeostasis, neurotransmission and host defense.

The [new technology](#) is called sNOOpy which stands for "sensor for

NO₃⁻/NO₂⁻ in physiology." sNOOOpy is a genetically encoded intermolecular fluorescence resonance energy transfer (FRET)-based indicator that senses levels of nitrate and nitrite. sNOOOpy utilizes the NO₃⁻/NO₂⁻—responsive two-component system of NasS and NasT system in the root nodule bacterium *Bradyrhizobium japonicum*.

The researchers demonstrated with in vitro and cell culture studies that sNOOOpy can monitor intracellular levels in the micromolar range of nitrate and nitrite in real time. The authors say, "sNOOOpy is simple and potentially applicable to a wide variety of living cells. It is expected to provide insights into NO₃⁻/NO₂⁻ dynamics in various organisms, including plants and animals." They also believe sNOOOpy will be useful for discovering new drugs and agricultural research.

This research was originally published in the *Journal of Biological Chemistry*.
