

Uncloaking the secrecy behind large-scale land deals

December 18 2015, by Jesse Coleman

Large-scale investments in agriculture and forestry have far-reaching implications for the lives of affected individuals and communities. They are also an integral part of efforts by national governments to implement the Sustainable Development Goals (SDGs) and improve the governance of land resources. Despite their significance, these "land deals" and the

contracts that govern them are often cloaked in secrecy, removed from relevant spheres of public scrutiny and debate.

A recently launched initiative seeks to reduce this "black box" nature of land deals. OpenLandContracts.org serves as the first online repository of publicly available land, agriculture, and forestry contracts. Launched in October 2015, this repository aims to promote transparency, facilitate disclosure, and catalyze broader awareness and understanding of land contracts and their implications.

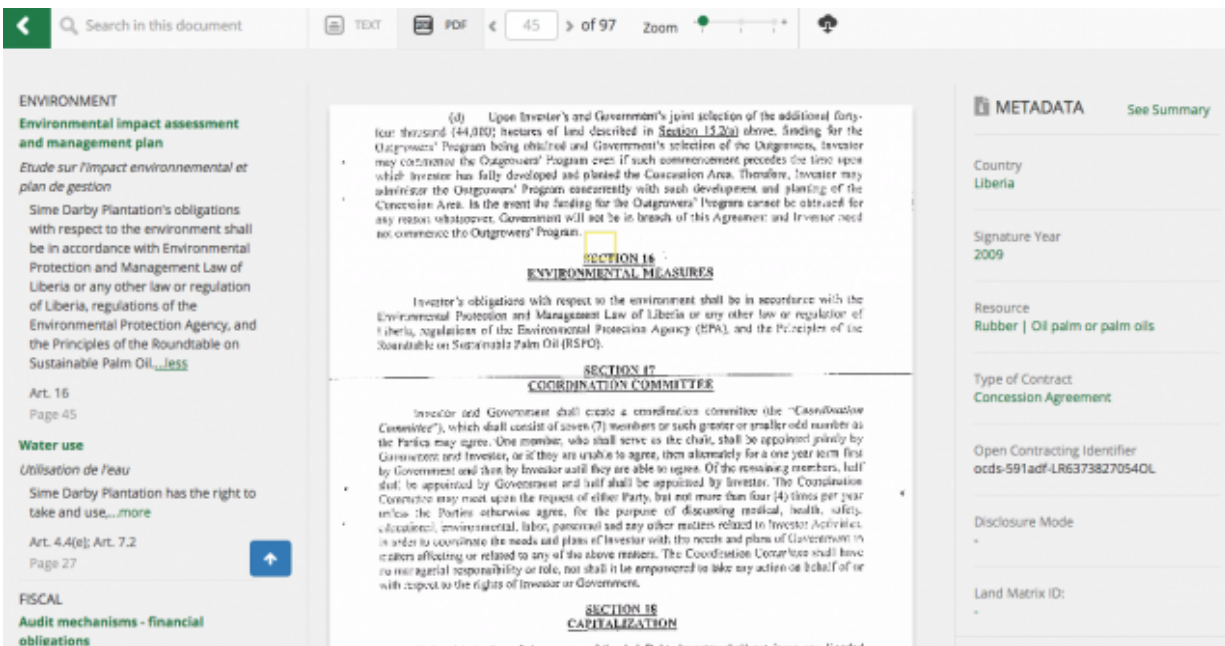

Why land contracts?

Land deals are frequently governed by contracts between host governments and investors. These land contracts play a pivotal role in determining the outcome of land deals, defining the parties' rights and obligations, allocating risk, and affecting a range of social, economic, and environmental issues. When considered alongside developments in international investment law, the impact of land contracts can be even more far-reaching. Investment treaties and the protections they create for investors can make it costly for states to modify or adopt new policies, potentially chilling efforts to improve land governance and promote responsible investment in agriculture and forestry.

Despite their public significance, very few governments disclose the land contracts they have signed. To date, only one country, Liberia, makes their commercial agriculture and forestry contracts publicly available. Two others, the DRC and Ethiopia, have disclosed some of their land contracts. Sierra Leone has recently committed to disclosing 70 percent of its agricultural lease agreements.

Aside from the contracts themselves, land contract negotiations generally take place behind closed doors, casting doubt on whether the interests of all relevant stakeholders are sufficiently represented by those at the

negotiating table. Local communities and land users, for example, are often precluded from participating in negotiations, or from shaping the outcomes of land deals that profoundly affect their lives. For such groups, land deals can result in dispossession, displacement, loss of livelihood, and violations of a wider network of rights that are deeply affected by access to and control over land and its natural resources.

The screenshot shows a document viewer interface with a search bar at the top left, navigation controls (TEXT, PDF, page 45 of 97, Zoom), and a sidebar on the left with a table of contents. The main content area displays text from a document, including a paragraph about land selection, a section header 'SECTION 16 ENVIRONMENTAL MEASURES', and a section header 'SECTION 17 COORDINATION COMMITTEE'. The sidebar on the left lists categories like 'ENVIRONMENT', 'Water use', and 'FISCAL'. On the right, there is a 'METADATA' section with fields for Country (Liberia), Signature Year (2009), Resource (Rubber | Oil palm or palm oils), Type of Contract (Concession Agreement), Open Contracting Identifier (ocds-591adf-LR6373827054DL), Disclosure Mode, and Land Matrix ID.

OpenLandContracts.org

The systemic lack of transparency that currently pervades land-based investment amplifies the challenges of promoting more responsible investment. OpenLandContracts.org seeks to reduce this lack of transparency by providing easy access to publicly available land contracts, and by equipping stakeholders with the tools necessary to

understand such contracts.

Among other features, the repository allows users to view and download contracts, and to search for specific types of contracts. Every contract in the repository has been (or is in the process of being) transcribed into text, thereby enabling searches within the text of contracts as well.

Because land contracts can be dense and complex, OpenLandContracts.org also provides plain-language summaries of each contract's key fiscal, social, environmental, operational, and human rights terms. Other resources to facilitate understanding, such as a Guide to Forestry Contracts, are also available on the website.

What next?

The OpenLandContracts.org team is continuing to improve and add to the repository. By early 2016, OpenLandContracts.org will host more than 100 contracts from around the world, as well as associated documents and other resources. Other enhancements planned for 2016 include a training module to further assist users in understanding and assessing contracts, as well as a feature to compare specific contractual provisions side-by-side. In addition, the OpenLandContracts.org team intends to collaborate with host governments to create country-specific repositories.

Innovative solutions are needed to ensure that the information gained through disclosure leads to better outcomes on the ground. To this end, two grants of \$10,000 each are being offered for the purpose of developing innovative uses of the repository and the content available through it. The OpenLandContracts.org team is currently seeking proposals for projects that make use of the repository to promote more sustainable land-based investments, support different stakeholders in understanding investments and their implications, or provide new insight

into such investments. Applications should be submitted to the Columbia Center on Sustainable Investment by March 31, 2016.

An important step on the path to broader reform

OpenLandContracts.org is a potential "game changer" in the path to broader reform of land deals. Disclosure of contracts is only one tool, however, with inherent limitations. More nuanced and careful engagement by all relevant stakeholders, particularly investors and governments, will be necessary to improve outcomes on the ground and promote more responsible and sustainable investment in agriculture and forestry.
