

# Artistic space odyssey to broadcast people's messages to the stars

February 8 2016

---

Messages from the earth will be beamed to the stars. Credit: Paul Quast

Messages from around the world are to be beamed into space at the speed of light as part of a cultural project to create a celestial time capsule.

In autumn 2016, dispatches from the public will be converted into [radio waves](#) and broadcasted towards the North Star, Polaris, this autumn, reaching their destination in 434 years.

The interstellar message in a bottle will comprise of people's responses to a single question: how will our present environmental interactions shape the future?

A Simple Response to an Elemental Message is a collaboration between the University of Edinburgh, the Royal Observatory of Edinburgh, and the UK Astronomical Technology Centre (UKATC) along with other partners.

Within 21 hours of transmission, the signal will have travelled deeper into space than mankind's first message to the stars, Voyager 1, which was launched in 1977.

Project Coordinator Paul Quast said Polaris was chosen as the destination because of its cultural significance as a reference point for navigators and star gazers.

Researchers will be able to use the responses to gauge if there are significant geographical differences in how people think about the environment and the future of the planet.

Edinburgh College of Art postgraduate student Mr Quast said: "We are at a pivotal point in this planet's history. Our present ecological decisions will have a massive impact on the future for all Earth's inhabitants. This project will create a culturally-inspired message in a bottle capturing global perspectives that will travel into space for eons."

The public are invited to visit the official website, <http://www.asimpleresponse.org>, and leave their contributions to be

broadcast into the cosmos.

The website is available in English, French, Spanish and Portuguese. German, Arabic, Russian and Mandarin will be available soon.
