

Eight dead sperm whales found on German beach

February 1 2016

This undated picture released by the state company of protection of the sea, shore and national park of Schleswig Holstein (LKN.SH) shows dead sperm whales ashore at the Kaiser Wilhelm Koog in Schleswig Holstein, northern Germany

Eight dead sperm whales have washed up on a German beach, just weeks after 12 of the giant mammals were found dead at other sites on the

North Sea, officials said Monday.

The eight [whales](#) found near the northern town of Friedrichskoog were young bulls, around the same age as the animals discovered three weeks ago at various North Sea spots.

They were lying close to each other in the mudflats of a restricted area of the Wadden Sea national park, the Schleswig-Holstein regional environmental authority said in a statement.

Since the 1990s, a total of 82 [sperm](#) whales have been found stranded in the Wadden Sea in Denmark, the Netherlands and Germany.

The sperm whale is the largest of the toothed whales, and the largest toothed predator.

It can measure up to 20 metres (67 feet) long and weigh over 50 tonnes.

"The males of this population spend their winters in the north Atlantic," the authority said.

"During their migrations, individual animals mistakenly wind up in the shallow and nutrient-poor North Sea."

The [shallow water](#) makes it difficult for them to use their acoustic orientation to navigate and many become beached.

Wildlife protection groups also blame the underwater noise from sea traffic and oil platforms for interfering with acoustic signals.
