## Worry Survey: Facts on Falling

Falls are the leading cause of fatal injury and the most common cause of nonfatal trauma-related hospital admissions among older adults.\*

every 20 minutes  
an older adult dies from a fall-related injury\*

83%

have a neighbor or staff member check in on their parents either every day or every week

54%

of adults with older parents worry about them falling

70%

worry at least every week that their parent will fall

81% of 1900 US adults would be interested in **NEW SENSOR TECHNOLOGY** that can **ANTICIPATE** falls.

Carnegie Mellon University's College of Engineering conducted a survey on falls among the elderly, and discovered that Americans are very worried about their elderly parent falling—and that this worry leads to action.

Every 13 seconds, an older adult is treated in the [emergency room](#) for a fall. Every 20 minutes, an older adult dies from a fall-related trauma. It's understandable, considering these statistics, why the College of Engineering survey found that 54% of 1900 U.S. adults are worried about an older parent falling, and why 81% of respondents expressed an interest in new sensor technology that can anticipate and prevent [falls](#).

Two researchers, Associate Research Professor of Electrical and Computer Engineering Pei Zhang and Assistant Professor of Civil and Environmental Engineering Haeyoung Noh, are currently developing such active fall-prevention sensors for both senior care facilities and private homes that can determine both who is in danger and where they are. Their technology monitors an individual's gait and can send mobile alerts not only to nurses and caregivers but also to the individual themselves if their gait changes threateningly. While the goal is to anticipate and prevent falls, the technology is programmed to immediately notify someone, which can include emergency responders, should an individual experience a sudden fall—even if the person is unconscious.

"Many older adults in senior care facilities are restricted to wheelchairs when not under the direct care of a nurse, but this technology could allow them to regain some of their independence," says Noh, whose

sensors are currently being tested at Vincentian Home in Pittsburgh and Lucas Physical Therapy and Fitness in Sunnyvale, California.

Of the 1,900 people in the survey, a little over 1,000 adults are concerned their parent may experience a fall, and 70% of these individuals worry at least every week, if not every day. The frequency and amount people worry is not influenced by whether the parent lives by themselves or not, though people are slightly less troubled if the parent lives in an assisted living or senior care facility. However, 62% of those with [parents](#) in assisted living or senior [care facilities](#) still worry once a week or every day.

All of this anxiety explains why, according to the survey, people are very responsive about caring for their parents. They frequently visit their parents, and also have neighbors or staff who look after them. 44% of respondents said they or a sibling checks in on their parent daily, while 33% said they or a sibling checks in every week. Another 12% said they stop by as needed. In addition, 56% of respondents reported that neighbors or staff physically check on their parent daily, while 27% said someone visits every week.

Although there was no difference among gender or age, the survey did discover that those with higher education levels and higher incomes worry less. The survey does not suggest why this may be, but it does show that those with higher incomes are not more likely to have their parent in a senior care facility or [assisted living](#) facility, nor are they more likely to have a live-in caretaker for their parent. However, it does appear that more people with [higher incomes](#) have Life Alert® for their parents—although only 15% of respondents have parents with Life Alert®.

"Our sensors are designed to predict and anticipate falls so individuals can worry less about their parents with the knowledge that our

technology will discover their parents are not walking the way they normally do, whether because of medication or because they've become fatigued," says Zhang.

*About the survey:* The first part of the survey included 1,900 adults representative of the U.S. population, while the second portion screened for the 1,000 adults among the original 1,900 who said they are worried about their parent falling. The [survey](#) was conducted with new sensor research at Carnegie Mellon University in mind to gain insight into how many people are worried about falls, what actions they take, and also to discover breakdowns for anxiety by demographic.
