

South Africa's great white sharks face extinction: study

July 20 2016

A Great White shark jumps out of the water as it hunts Cape fur seals near False Bay, South Africa, on July 4, 2010

South Africa's great white sharks face the threat of extinction after a rapid decline in numbers caused by trophy hunting, shark nets and pollution, according to a study released Wednesday.

The six-year research project along the country's coastline revealed that only between 353 and 522 of the [sharks](#) are still alive, half the level previously thought.

"The numbers in South Africa are extremely low. If the situation stays the same, South Africa's great white sharks are heading for possible extinction," said study author and Stellenbosch University researcher Sara Andreotti.

Scientists conducted the census by collecting biopsy samples and photographs of dorsal fins of the great predators, including in the Gansbaai area, near Cape Town, a hotspot for shark cage diving.

"We have come to the conclusion that South Africa's [white sharks](#) faced a [rapid decline](#) in the last generation and that their numbers might already be too low to ensure their survival," said Andreotti.

The study published in the journal *Marine Ecology Progress Series* also blamed [shark nets](#), ocean pollution and baited hooks on the eastern seaboard of South Africa for the dwindling numbers.

"The chances for their survival are even worse than what we previously thought," said Andreotti.

About 333 of the sharks are thought to be capable of breeding.

Although the great whites population has dropped off South Africa, the report said the sharks were still found in large numbers off the coast of Canada, Australia and the United States.

The South African coast is notorious for shark attacks, with regular cases of deadly mauling of surfers and swimmers.
