

## In the global race for rare metals, Team China wins gold

September 9 2016, by Dylan Mcfarlane And Robert Pell

Just as oil and gas has raised the stature of countries like Saudi Arabia in the <u>age of oil</u>, countries that dominate the production of metals are set to benefit similarly in the rare metal age.

Rare metals, which are produced in limited amounts and often in just a few <u>countries</u>, play critical roles in the next generation of products: they store power, provide luminescence and make <u>products more efficient</u>. Tesla vehicles, iPhones, Boeing 787s and even <u>night vision goggles</u> rely on the specific properties of a host of difficult-to-pronounce obscure metals.

Because of the global explosion in high-tech wizardry, people rely on the production of <u>more metals on the periodic table than ever before</u>. And because of the high number of <u>rare metals</u> it takes to produce <u>green</u> <u>products</u>, it's no understatement to say that the <u>fate of the planet is tied</u> to these materials.

Over the Olympic season, countries rank their international stature on medal counts achieved during the games as a proxy for a country's geopolitical stature. But the "real metal count" has a greater impact on the fate of nations.

To give an idea of how countries are doing, we produced two infographics to show the most notable changes in global producers from 1970 and 2015. It tallies the first, second, and third leading producers of all major and minor technology metals.

For each major mineral commodity, the world's leading producer earns a gold medal, second leading producer a silver medal, and third leading producer a bronze medal. Credit: (Data source: USGS) Dylan McFarlane, Robert Pell, David Graham, Author provided

From the metal tables you can see that no country has succeeded in the real metal race like China. Through geological good fortune, along with a sustained focus on the production of rare metals at lower costs than other countries, China is poised to reap the gains from their production. Their focus on producing these metals is important. Finding secure,

stable supplies outside China is a goal of two international research projects, SoS Rare and HiTech AlkCarb.

The Real Metal Count in 2015

For each major mineral commodity, the world's leading producer earns a gold medal, second leading producer a silver medal, and third leading producer a bronze medal. Credit: (Data source: USGS) Dylan McFarlane, Robert Pell, David Abraham, Author provided

Unlike Saudi Arabia, which sought riches from the sale of its resources, China seeks to capitalise on building downstream industries – for example, by making smartphones using home-produced components through its industrial strategy: Made in China 2025. These resources are

then a great means to continue to expand their manufacturing prowess.

David Abraham, senior fellow at New America, assisted in the production of the piece.
