

Discovery of a facile process for H₂ production using ammonia as a carrier

April 28 2017

H₂ production from ammonia and oxygen triggered at room temperature without external heat input. Credit: Oita University

Hydrogen (H₂) has attracted considerable attention as a clean energy source because the only by-product of its reaction with oxygen is water, and high efficiency for energy conversion is achieved when it is combined with fuel cell technologies.

However, low volumetric [energy](#) density and the dangers of transporting and handling H₂ are drawbacks for commercial applications. These problems could be eliminated by using [ammonia](#) as a H₂ storage medium (H₂ carrier).

H₂ produced from ammonia is utilized in fuel cells, engines, and turbines. However, the adoption of ammonia as a H₂ carrier, especially for household and transportable devices, has been limited due to the lack of an efficient [process](#) for producing H₂ and nitrogen by ammonia decomposition.

To overcome this limitation, the research team, led by Dr. Katsutoshi Nagaoka and Dr. Katsutoshi Sato, set out to develop a process that could be initiated rapidly, and that could produce H₂ at a high rate without the need for external heat.

They found that H₂ can be produced by supplying ammonia and oxygen at room temperature to a pre-treated RuO₂/γ-Al₂O₃ catalyst without external heating. The heat evolves by ammonia adsorption onto this catalyst, increasing it to the catalytic auto-ignition temperature of ammonia. Subsequently, production of H₂ by oxidative decomposition of ammonia begins. In this process, once the [reaction](#) is initiated, it can start again repeatedly even if there is no external heat supply because adsorbed ammonia is desorbed during the reaction.

Dr. Nagaoka said, "Our discovery utilizes a simple fundamental physicochemical process, namely adsorption, to operate a reaction with minimal energy input. We expect this to contribute to the development of efficient, carbon-free energy production and thus to global solutions for energy and climate crises."
