Indonesian authorities have raised the alert level for the Mount Agung volcano on the tourist island of Bali to the highest level, and some 10,000 villagers have left their homes around the mountain, officials said Friday.

It was the third time in little more than a week that the alert level has been raised. The Department of Meteorology, Climate and Geophysics said there has been a "tremendous increase" in [seismic activity](#) at the mountain, indicating a greater probability of an eruption, though it couldn't give a timeframe.

The National Disaster Mitigation Agency said no residents or tourists should be within 9 kilometers (6 miles) of the crater and within 12 kilometers (7.5 miles) to the north, northeast, southeast and south-southwest.

The agency earlier said about 9,400 villagers have evacuated from their houses and are scattered across the districts of Karangasem, Klungkung and Buleleng.

They are living in temporary shelters, sports centers, village halls and with relatives, said agency spokesman Sutopo Purwo Nugroho.

The 3,031-meter (9,944-feet) Agung last erupted in 1963, killing about 1,100 people and hurling ash as high as 10 kilometers (6 miles).

The mountain, 72 kilometers (45 miles) to the northeast of the [tourist](#) hotspot of Kuta, is among more than 120 [active volcanoes](#) in Indonesia.

The country of thousands of islands is prone to seismic upheaval due to its location on the Pacific "Ring of Fire," an arc of volcanoes and fault lines encircling the Pacific Basin.

More than 7,000 of the evacuees were in the 840 [square kilometer](#) (325 square mile) district surrounding the [volcano](#), Karangasem, which is home to about 408,000 people.
