

# Why Australia is bucking the trend on male births

October 19 2017

---

New research from the Australian National University (ANU) shows Australia is bucking an international trend of a declining number of males being born compared to females, primarily due to the high number of boys being born in the ACT.

The study also sheds new light on a well-known theory that boys are more likely to be born to women of high wealth, suggesting that it could be expecting mothers' psychological perception of their wealth that is the decisive factor.

As international trends for industrialised nations such as Canada, the UK and the US show fewer boys are being born, in Australia that [trend](#) is reversed.

Lead researcher Dr Alison Behie, Head of ANU Biological Anthropology, said the reason Australia bucked the trend was due to the high number of boys being born in the ACT.

"In the ACT there is frequently a higher number of boys born relative to girls compared to other states or territories," Dr Behie said.

"In most states in Australia around 105 boys will be born for every 100 girls. In the ACT there are around 110.

"Without the ACT numbers Australia would be consistent with the global trend for other industrialised countries."

Dr Behie said the reason for the statistical anomaly in Canberra could be psychological.

"Our study looked at a range of maternal characteristics to see if any were an accurate indicator of whether mothers will give birth to boys or girls," she said.

"We tested maternal education, age, bodyweight, income, but the only one that proved to be a reliable predictor was a measure known as 'perceived wealth'.

"We found women who view themselves as being prosperous and wealthy are, biologically, having more boys."

Dr Behie related the results to the Trivers-Willard hypothesis - a theory that good maternal conditions will result in an increase of males born.

"It's well known that boys are more fragile, they are more likely to die in the womb or in childhood which is why it is normal to have more boys born than [girls](#) in any population," Dr Behie said.

"Our research shows this may come from perception. Having the perception of prosperity is potentially more important than actually having the money or resources."

The study used a data sample of 5,000 births across Australia over a period of 12 years. The results have been published in a paper for the *Journal of Biosocial Science*.
