

Drivers are less cautious at railway crossings

October 11 2017

Drivers aren't as cautious approaching a railway level crossing compared to a road intersection despite the greater risk of fatality if a collision occurs, a new QUT study has found.

The results of the research will be presented at the 2017 Australasian

Road Safety Conference being held in Perth today.

Dr Gregoire Larue, from QUT's Centre for Accident Research & Road Safety - Queensland (CARRS-Q), has found [drivers](#) approach level crossings at significantly faster speeds than road intersections.

"We saw that drivers were preparing to stop 75 metres before the road [intersection](#) but only 30 metres before a level crossing without lights or boom gates," he said.

"Drivers were therefore forced to stop much more abruptly at level crossings."

Another key finding of the study was that drivers spend a lot less time assessing the situation at a level crossing than they do at a [road](#) intersection without traffic.

Dr Larue said this meant drivers might not adequately assess whether a train was approaching, given that trains could arrive much faster than cars, and were unable to take evasive action.

"The study also found drivers did not appropriately adapt their driving behaviour to the reduced visibility of night-time driving," Dr Larue said.

"This suggests that drivers may experience difficulty in recognising the presence of a level crossing, or identifying the actions required for the type of level [crossing](#) they are approaching."

With about 70 collisions at railway level crossings in Australia each year and most resulting in fatalities, Dr Larue said it was essential to understand driver behaviour when approaching level crossings.

"These findings will help guide the design of initiatives to improve

[safety](#) at level crossings. We should consider developing active advanced warnings for level crossings that don't have lights and boom gates."

The 2017 Australasian Road Safety Conference draws together experts from across the globe to share the latest in research, programs and developments with the aim of reducing injuries and deaths on our roads.
