

Locals warned to stay away as Japanese volcano erupts

October 11 2017

Mount Shinmoedake, one of Japan's scores of active volcanoes, last erupted in January 2011

Mount Shinmoedake in southern Japan erupted for the first time in six years Wednesday, shooting a plume of ash several hundred metres into the air and sparking warnings to local residents.

People were ordered to stay away from the volcano after it rumbled to

life at 5:34 am (2034 GMT Tuesday) as Japan's Meteorological Agency said air blasts caused by the eruption could shatter windows.

"The [ash plume](#) reached a height of 300 metres (1,000 feet) when the volcano erupted," an agency official told AFP, adding that the eruption would continue and "become more active".

Ash deposits would spread as far as two kilometres from the crater, the agency warned.

Authorities raised its alert to level three, meaning that locals should avoid approaching the volcano. They detected 90 small tremors on October 5 near the mountain, which featured in the 1967 James Bond film "You Only Live Twice".

Japan, with scores of active volcanoes, sits on the so-called Pacific "Ring of Fire" where a large proportion of the world's earthquakes and [volcanic eruptions](#) are recorded.

On September 27, 2014, Japan suffered its deadliest eruption in almost 90 years when Mount Ontake, in central Nagano prefecture, burst unexpectedly to life.

An estimated 63 people were killed in the shock eruption which occurred as the peak was packed with hikers out to see the region's spectacular autumn colours.
