

Biodiversity crisis summit kicks off in Colombia

March 18 2018, by Joaquin Sarmiento, With Florence Panoussian In Bogota

Colombian President Juan Manuel Santos delivers a speech during the opening of the sixth plenary session of the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) in Medellin

A comprehensive, global appraisal of mass species extinction—and what

can be done to reverse it—kicked off in Colombia's second-largest city Saturday, with more than 750 experts in attendance.

President Juan Manuel Santos opened the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) meeting in Medellin by stating that protecting biodiversity is "as important as fighting climate change."

Hundreds of scientists and government envoys are gathering at the event, which runs through March 26, to finalize details on five monumental reports designed to inform global policymaking into the future.

"Today the world is at a crossroads," added IPBES president Sir Robert Watson.

"The historic and current degradation and destruction of nature undermine human well being for current and countless future generations."

Compiled over the last three years, the reports will provide the most up-to-date picture of the health of the world's plants, animals and soil.

'Immensely ambitious'

The diagnosis will be unveiled in two parts.

First, on March 23, the IPBES will release separate assessments for the four regions into which it has divided the world—the Americas, Africa, Asia-Pacific, and Europe and Central Asia.

Orangutans in Borneo are just one of the world's many threatened species as Earth faces a biodiversity crisis

Then on March 26 a report will be released focusing on the global condition of soil, which is fast being degraded through pollution, forest-destruction, mining, and unsustainable farming methods that deplete its nutrients.

The evaluations took 600 volunteer scientists three years to complete, and includes summaries of data taken from about 10,000 scientific publications.

The end product covers the entire Earth apart from Antarctica and the open oceans—those waters beyond national jurisdiction.

Host Colombia claims it has the world's largest variety of birds and orchids, and is second only to Brazil in terms of overall species diversity.

Paradoxically, decades of Colombia's internal conflict have preserved fragile habitats in no-go zones of the country, whose mountainous topography supports 311 different ecosystems.

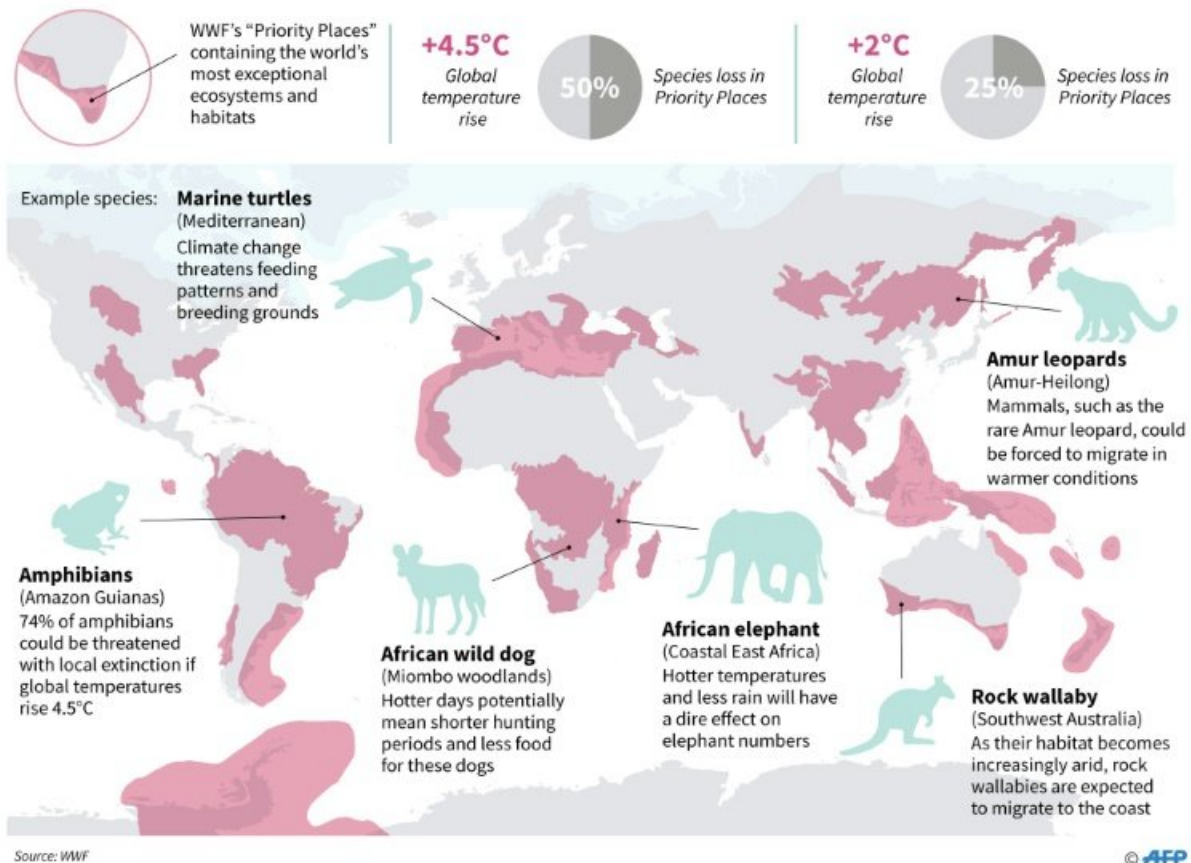

But 1,200 Colombian species are listed as threatened, due partly to pollution and forest-destruction caused by illicit drug production.

More than just a portrayal of doom and gloom, the latest assessments will include projections for future recovery or decline, and "suggestions for action," IPBES executive secretary Anne Larigauderie told AFP.

"An immensely ambitious challenge lies ahead of us this week," she said Saturday.

Global warming threat to key areas for biodiversity

WWF has identified 33 "Priority Places" that host some of the world's richest ecosystems, warning that up to half the species in these spots face extinction if climate change is left unchecked

Hotspots where climate change puts species in some of the world's richest ecosystems at the greatest risk

The expert panel, she said, had compiled five assessment reports, each about 600-900 pages long and condensed into a 20-30 page "summary for policymakers."

These summaries must be officially adopted in Medellin before being sent to IPBES member states to guide policymaking in areas that affect biodiversity—everything from transport and infrastructure to farming,

water management and education.

The reports however are not prescriptive. "We hope that this will help inform policy decisions to stem the loss of biodiversity and the fundamental services it provides us with," chief scientist Tom Brooks of the International Union for the Conservation of Nature told AFP.

Following the opening formalities late Saturday, delegates will hunker down for days of intense, "word-by-word" negotiations on the five summary documents.

The drafts in their current form will be presented to a joint IPBES meeting on Sunday, after which delegates will meet in five groups—one for each report.

Governments will have a final chance to request changes to the wording of the summaries. If the scientific authors disagree, a compromise must be found through negotiation.

The whole process has cost about \$5 million (four million euros).

This complex drafting process, Larigauderie said, is crucial to get as many governments as possible on board, for a better chance of them adopting biodiversity-friendly policies as a result.
