New animal species are sometimes named after celebrities because of their trademark looks. That's how we got the blonde-haired Donald Trump moth and the big-armed Arnold Schwarzenegger fly, to name a few. However, some well-known people are enshrined in animal names

not for their looks, but rather for what they do for the environment.

This is exactly how a newly discovered water beetle, described in the open access journal *ZooKeys*, was given the name of Hollywood actor and environmentalist Leonardo DiCaprio. The tribute marks the 20th anniversary of the celebrity's Leonardo DiCaprio Foundation (LDF) and its efforts towards biodiversity preservation.

The Leonardo DiCaprio Foundation has become one of the world's foremost wildlife charities, having contributed to over 200 grassroots projects around the globe devoted to climate change mitigation, wildlife conservation, and habitat preservation.

"We can all have an impact," [says DiCaprio](#) in a special LDF video, "but we have to work together to protect our only home."

Going by the scientific name of *Grouvellinus leonardodicaprioi*, the new water beetle was discovered at a waterfall in the remote Maliau Basin, Malaysian Borneo, during the first field trip initiated by Taxon Expeditions - an organisation which arranges scientific surveys for untrained laypeople with the aim to discover previously unknown species and bridge the gap in biodiversity knowledge.

Having identified a total of three water beetle species new to science, the expedition participants and the local staff of the Maliau Basin Studies Centre voted to name one of them after DiCaprio in honour of his efforts to protect untouched, unexplored wildernesses just like Maliau Basin itself.

"Tiny and black, this new beetle may not win any Oscars for charisma, but in biodiversity conservation, every creature counts," said Taxon Expeditions' founder and entomologist Dr. Iva Njunjic.
