

Uber resumes testing for autonomous cars in 'manual mode'

July 24 2018

Uber, which suspended its autonomous car testing for four months following a fatal accident, says it will resume tests but with a driver at the wheel at all times, to gather data on safety

Uber said Tuesday it was taking the first step toward restarting its autonomous ridesharing program, putting its self-driving cars back on

the road in "manual mode," with a driver at the wheel at all times.

The ridesharing giant said its specially equipped vehicles would be back in service for the first time since it suspended tests following a [fatal accident](#) in Arizona.

"We're starting with cars in [manual mode](#), with a mission specialist sitting behind the wheel and manually controlling the vehicle at all times," Uber said in a statement announcing the new testing in Pittsburgh, Pennsylvania.

"While we are eager to resume testing of our self-driving [system](#), we see manual driving as an important first step in piloting these safeguards."

The testing will enable Uber to gather data on different scenarios that will be recreated in computer simulations, and also develop more accurate mapping for the vehicles.

Uber suspended its autonomous driving testing in several locations in the United States after the March accident in Arizona that killed a pedestrian.

The National Transportation Safety Board said in a preliminary report in May that the car's sensors detected the pedestrian six seconds ahead of the crash but failed to activate emergency braking.

The NTSB said Uber's engineers had disabled an automatic emergency braking system "to reduce the potential for erratic vehicle behavior."

The pedestrian was dressed in dark clothing and was pushing a bicycle that had no side reflectors when she crossed a unlighted section of roadway.

Uber said that in the new tests in Pittsburgh, the self-driving vehicles will have a driver-monitoring system "to help ensure mission specialists are remaining attentive behind the wheel."

The system will send an audible alert if it detects [driver inattention](#).

Uber said its automated collision avoidance systems will remain enabled during manual driving—activating emergency braking when it detects a potential accident.
