New York officials say their deal to land a new Amazon headquarters is a big win for the city—but the math is a little more complicated than government projections indicate.

The state's predicted 9-to-1 return on investment was based on a widely used economic model that compares the cost of tax incentives with expected gains in tax revenue.

Those projections indicate that in exchange for up to \$3 billion in tax breaks and grants, Amazon's new campus in Queens will generate \$27 billion in new taxes over a quarter-century.

But experts note the analysis doesn't include added [costs](#) of providing public services like schools, police and fire to Amazon workers and their families, giving the public an incomplete picture of the project's overall costs.
