

The suburbs are the spiritual home of overconsumption. But they also hold the key to a better future

December 13 2018, by Samuel Alexander And Brendan Gleeson

Suburban affluence is the defining image of the good life under capitalism, commonly held up as a model to which all humanity should

aspire.

More than half of the world's population now lives in [cities](#). Yet with the [global economy](#) already in gross [ecological overshoot](#), and a world population heading for more than [11 billion](#), this way of living is neither [fair](#) nor sustainable.

To live within our environmental means, the richest nations will need to embrace a planned process of economic "degrowth". This is not an unplanned recession, but a deliberate downscaling of economic activity and the closely correlated consumption of [fossil energy](#). We don't argue this is likely, only that it is necessary.

You might naturally assume this will involve pain and sacrifice, but we argue that a "[prosperous descent](#)" is possible. Our new book, [Degrowth in the Suburbs: A Radical Urban Imaginary](#), envisions how this might unfold in the suburban landscapes that are currently emblematic of overconsumption.

The well-known documentary [The End of Suburbia](#) presented a coherent narrative of a post-petroleum future, but got at least one thing wrong. There is not a single end to suburbia; there are many ends of suburbia (as we know it).

Reimagining the suburbs beyond fossil fuels

Suburban catastrophists such as James Kunstler argue that fossil fuel depletion will turn our suburbs into urban wastelands. But we see the suburbs as an ideal place to begin retrofitting our cities.

This won't involve tearing them down and starting again. Typically, Australia's built environment is turned over at less than 5% per year. The challenge is to reinhabit, not rebuild, the suburban landscape. Here are

some of the key features of this reinvigorated landscape:

- Suburbanites can and should [retrofit their homes and develop new energy practices](#) to prepare for an [energy descent future](#).
- Households must be encouraged to [downshift consumerism](#), swapping superfluous "stuff" for more free time and other sources of meaning and well-being. An [economics of sufficiency](#) involves borrowing and sharing rather than always buying and upscaling.
- We should reclaim and reimagine areas of the built environment that are misused or underused. The vast areas dedicated to [car parking](#) are but one example.
- Finally, and most importantly, we should realise that change must come via [grassroots political organisation](#), rather than waiting for growth-fixated governments to lead the way. This is not to deny the need for "[top-down](#)" structural change. Our argument is simply that the necessary action from governments will not arrive until there is an active culture of sufficiency that demands it.

What social forces might produce this necessary but elusive urban transformation? We think it can be driven by two broad social groups: the [disillusioned middle class](#) and the exploited working [class](#). These two groups, which already blur together along a spectrum, can potentially become a cohesive urban social movement of transformative economic and political significance.

The disillusioned middle class: radical downshifters

Our first groups consists of employed professionals, bureaucrats, and tradespeople who have secure housing, earn decent wages, and can direct

significant portions of their income to discretionary spending. This sector of society participates, consciously or unconsciously, in what is often called "[consumer culture](#)".

This consumerism often [fails to fulfil its promise](#) of a rich and meaningful life. The consumer class has been sold a lie, and many affluent consumers are now developing what social scientist Ronald Inglehart calls "[post-materialist](#)" goals and values. This emerging way of life involves seeking purpose and satisfaction in life through things other than material riches, including deeper community engagement, more time to pursue private passions, or even increased political action.

This is significant, for three reasons. First, [history](#) shows that [social movements](#) tend to be sparked by dissatisfaction with the status quo – otherwise, why would people resist or seek alternatives? The [deep disillusionment](#) with materialistic lifestyles provides an incentive to explore alternative, more satisfying ways to [live](#) and [self-provide](#).

Second, by withdrawing their spending from the market economy, this emerging [social movement](#) can undermine that economy and fast-track its [transformation](#).

Finally, a "radical downshifting" in consumption could allow people to free up their time by working less. This will provide people with more [time to participate](#) in building [new forms](#) of economy and engaging in collective action for change. The "voluntary simplicity movement" already numbers as many as [200 million people](#), although its potential depends on more organised and radical expressions.

The exploited working class: economic builders

Radical downshifters will never transform the economy on their own, and this is where our second group comes in. Working-class urbanites,

while also drifting into superfluous consumption, are typically characterised as individuals and households who are "battling" to make ends meet.

Again, a growing dissatisfaction with the status quo provides the incentive to seek and participate in fundamental change. We are often told that Australia's economy has grown uninterrupted for a quarter-century, yet many people feel their personal circumstances have [stagnated](#).

There has indeed been growth, yet almost all the benefits have been siphoned away by the [wealthy](#). Why would the working class owe any allegiance to a system that only benefits the rich? As the battlers realise they are being oppressed and duped by an [unjust system](#), they threaten to become a dynamite class of explosive [potential](#).

As economic crises threaten to [intensify](#) in coming years – including the challenge of automation – we maintain that the exploited working class may be driven to explore alternative ways to self-provide. As incomes become more meagre and jobs less secure, more people will need to seek alternative ways of meeting economic needs "beyond the market".

Whether through necessity or choice, we foresee a growing number of people beginning to participate in informal, non-monetary, and [local](#) economies, including the [sharing economy](#). Just as radical middle-class downshifters will help stifle economic growth by withdrawing their discretionary spending, those who are less affluent could begin to lay alternative economic foundations, and provide a [post-capitalist social safety net](#).

Working together

We contend that these two social groups – the disillusioned [middle class](#) and the exploited working class – can conceivably form a cohesive movement with similar goals. The capitalist system isn't working for many people, even those who are "winning" the rat race. Furthermore, historic growth trajectories seem to be coming to an end, due to both [financial](#) and [ecological](#) constraints.

Already, a diverse range of movements are working towards a new urbanity. These include local farmers' markets and community and home gardens, [urban agriculture projects](#), freecycling groups, [sharing communities](#), and repair cafes. It also includes the growing pool of

climate activists, [divestment](#) organisers, [permaculture](#) groups, [transitions towns](#), and progressive [unions](#).

There is the small but vocal "[save our suburbs](#)" network, in which we see the seeds of something more progressive. And it includes the [energy frugal households](#) quietly moving towards solar, batteries and increased energy self-sufficiency. One by one, these households are [undermining](#) the fossil fuel industry and subtly disrupting the status quo.

As financial and ecological crises deepen in coming years, the social consciousness needed to develop new systems of production and cultures of consumption will become compelling. Together these social groups (and others not yet imagined) could form an urban social movement that withdraws support for the existing system and begins building [new economies](#) on our suburban streets.
