

What the data say about discrimination and tolerance in New Zealand

Following the Christchurch mosque shootings, there has been

considerable discussion of intolerance and experiences of discrimination in New Zealand.

For example, Anjum Rahman, a spokesperson for the Islamic Women's Council, has expressed concerns about [rising levels of discrimination](#) against the Muslim community.

This discussion has been driven by specific examples of discrimination or intolerance. Such anecdotes clearly prove wrong the idea that New Zealand is free of discrimination or [intolerance](#), but they provide no evidence of societal prevalence of such experiences and attitudes.

My aim here is to consider data on the occurrence of discrimination and the extent of tolerance across New Zealand society, in aggregate and by different groups. This allows some generalisable conclusions about what we do and don't know.

Experiences of discrimination

[Stats NZ](#)'s most recent [General Social Survey](#) (collected between April 2016 and April 2017) allows a consideration of local discrimination and tolerance. It uses an officially collected and statistically representative population sample. It also enables an analysis by subgroups defined by migrant status, main ethnic category and region.

Aggregating across all experiences of discrimination (e.g. by ethnicity, age, gender, dress, language, religion, sexual orientation etc), and hence maximising reported discrimination, most New Zealanders (83.1%) report no discrimination in the previous year. There is little difference in reported discrimination between New Zealand-born people (83.5% report no discrimination) and long-term migrants (83.7%). However, while a large majority of recent migrants (74.3%) report no discrimination, the figure was smaller.

Across all major ethnic categories, the large majority report no discrimination. Of New Zealand Europeans, 85.4% report no discrimination. Rates for Pacific (80.1%), Māori (74.4%) and Asian New Zealanders (73.4%) are lower, but still high.

In terms of regional differences, 83.1% of Cantabrians (where Christchurch is) report no discrimination, identical to New Zealand-wide rates. On this evidence, Canterbury is not a local hotbed of discrimination.

How big are the observed difference in discrimination between groups reported above? The [standard social science approach](#) divides population differences into "small", "medium" and "large". On the basis of this division, the most elevated experiences of discrimination experienced by ethnic minorities and recent migrants are closest to small in size.

Tolerance of ethnic and religious diversity

In terms of tolerance, the large majority of New Zealanders are comfortable or very comfortable with a neighbour with a different religion (87.4%). They feel the same comfort regarding a neighbour from a different ethnic group (88.7%).

The one case where only a small majority express comfort involves a neighbour with a mental illness. Only 53.2% of people are very comfortable or comfortable here.

There are no notable differences in tolerance by migrant status, ethnic category or region. Hence, with the exception of the mentally ill, all groups share a majority value of out-group tolerance, and harbour a similar small share of the intolerant.

There is no official data on discrimination experienced by Muslim New

Zealanders compared to other groups. Equally, there is no official data on Muslim tolerance of other ethnic and religious groups as neighbours.

However, there is information from the [New Zealand Attitudes and Values Study](#) on negative attitudes, in the form of reported [anger](#). People report on a 1 to 7 scale, where 1 is "No anger", 4 is "Neutral", and 7 is "Anger". People report on anger towards several main ethnic categories, as well as Muslims, a religious group. In terms of the sampling approach, these data are less well suited for answering population questions than the official Statistics New Zealand data.

Bearing this caveat in mind, the survey shows a broad lack of out-group negativity. Most societal responses fall between "No anger" and "Neutral". For example, 91.3% of non-Pacific people [report](#) "No anger" to "Neutral" attitudes towards Pacific people. Comparable out-group figures for Asians are 90.3%, for New Zealand Europeans 87.3% and for Māori 86.0%.

All these figures are basically identical. For Muslims the number is slightly lower at 81.9%. But in all cases the share of society in the "No anger" to "Neutral" zone is a large majority. Equally, differences between Muslims and ethnic groups are small.

Unfortunately there are no other religious groups where the anger question is asked. This means there is no benchmark to compare out-group anger towards Muslims. Data on anger towards Evangelical Christians, Hindus or Jews are not collected.

While [discrimination](#) experienced by minority groups, defined by migrant status and ethnic category, clearly exists, it is not the experience of a large majority of New Zealanders from any of these groups. Furthermore, group differences are small.

The large majority of New Zealanders also seem to be tolerant, including of different ethnic groups and religions, and are not angry, as far as one can tell, towards Muslims.

There appears to be, however, a small elevation in anger towards Muslims compared to ethnic groups. But whether anger is greater towards Muslims compared with other religious minorities remains unclear from the available evidence. It is worth observing that all religious groups, Muslim or otherwise, are minorities in New Zealand.
