

# Lessons from Columbine: New technology provides insight during active shooter situations

June 26 2019

Purdue University researchers created a computer model to provide training for active shooter situations. Credit: Eric Dietz/Purdue University

Run, hide, fight. It has become a mantra for how to act during an active shooter situation. The idea is to escape the situation or protect oneself, and counter the gunman as a last resort.

A Purdue University researcher and his students have come up with a novel way to test how well "run, hide, fight" works in an active shooter situation. They created a computer model, based on the 1999 shooting at Columbine High School, which looks at what happens to victims caught in shooter situations to provide better training for schools and other organizations.

"We obviously hope these tragedies are avoided, but we want to provide information that those caught in active shooter situations can use to survive and potentially help others make it out alive," said Eric Dietz, director of the Purdue Homeland Security Institute and a professor of computer and [information technology](#) in the Purdue Polytechnic Institute.

Dietz and his students worked with the AnyLogic Co., a group based in Chicago that creates simulation tools, to develop their [computer](#) model. The Purdue team presented its model at the AnyLogic Conference in April in Austin, Texas.

The Purdue team used its [computer model](#) to focus on what happened inside the library at Columbine on the day of the shooting. The researchers have run multiple scenarios to determine the likely number of victims and survivors based on various actions taken by those caught in the library when the massacre began.

"We find that the number of casualties is higher in situations like Columbine when more people try to hide instead of run," said Dietz, who previously served as the founding executive director of Indiana's Department of Homeland Security. "That's not to say it is the best action

every single time, but rather we want to use our model and some of our research to better inform schools on active shooter training and survival information. Running from the situation is often linked to the best outcomes."

Dietz and his team at the Purdue Homeland Security Institute are working on a number of projects related to public safety. They have worked with the Purdue Research Foundation Office of Technology Commercialization on patenting some of their technology.
