

# Panama marks 20 years in charge of canal, faces climate threat

December 31 2019, by Juan José Rodríguez

---

The United States handed control of the Canal to Panama on December 31, 1999

Panama on Tuesday marks two decades of control over the vital interoceanic Canal following its return by the United States, but worries over weak traffic and climate change loom.

On December 31, 1999 at midday sharp, then-president Mireya Moscoso hoisted Panama's red, blue and white flag over the Canal administration building for the first time.

The entire Central American nation was swept with joy, having finally received sovereignty over the Canal after 85 years of management by the US, which built and inaugurated the ocean route in August 1914.

Twenty years later, recurrent droughts caused by climate change are the main threat to the 80 kilometer-long [canal](#) between the Atlantic and Pacific oceans, through which mostly American, Chinese and Japanese merchant ships pass.

"The impact of climate change is quite evident on the Panama Canal," warned its administrator Ricaurte Vasquez.

A historic deficit of rainfall has lowered the water level in the lakes which supply the Canal and the "challenge is now to find the solution to this lack of water for the next 50 years," he explained.

### **Future uncertain**

According to the Panama Canal Authority (ACP), the rainfall deficit reached 27 percent in 2019 compared to the average.

In addition, the temperature of Gatun Lake, the main tributary of the Canal, has increased by 1.5 degrees Celsius over the past ten years, which causes significant loss of water by evaporation.

That has meant the Canal only had three billion cubic meters of water this year, instead of the 5.2 billion cubic meters needed for its normal

operation.

"Climate change is already hitting us. For me, this is the main threat hanging over the Canal," former administrator Jorge Quijano told AFP.

To remedy the situation, Panama is studying the possibility of finding other freshwater resources for the Canal, such as pumping or desalinating seawater, or even building reservoirs.

But these are costly and complicated solutions that could cut into the Canal's contributions to Panama's finances—nearly \$1.8 billion in 2019.

Meanwhile, Canal authorities fear shipowners will prefer other sea routes that avoid the Central American isthmus, such as the Suez Canal, which, according to the ACP, has lowered its rights of passage by 60 percent.

In addition, [global warming](#), by melting the polar ice, could open "especially in the north, new competitive maritime routes," Felipe Chapman, associate director of the economic consultancy Indesa, told AFP.

## **Commercial traffic falls**

The Canal was widened in 2016 and is used mainly to link Asia to the east coast of the United States, but is also suffering from a decrease in commercial traffic as the [global economy](#) slows.

This danger is obviously "out of Panama's control, and stems from the consolidation of the Asian economies, especially China," Horacio Estribi, an advisor to the Panamanian economy minister, told AFP.

Until recently, a little less than five percent of world trade transited

through Panama, but this figure has fallen to 3.5 percent, according to the Canal's administrator.

The Canal nevertheless did record business in [fiscal year](#) 2019 with about \$3.37 billion generated from tolls, services and the sale of electricity from its dams, along with 450.7 million tons of goods passing through.

But the center of gravity of world trade traffic has shifted to Asia and Europe, according to the Canal Authority.

"You have to see how the standoff over trade between the United States and China ends," said Quijano, who further warned, "As production moves further west from Asia, the route through Panama becomes less attractive."
