

Connection found between Arctic Oscillation and increased risk of fire in Siberia

January 9 2020, by Bob Yirka

Fire activity over southeastern Siberia. (A) Mean burned area fraction ($\% \text{ year}^{-1}$) over mid- and high latitudes in the Northern Hemisphere. Hatched areas indicate permafrost regions. The black box indicates the study area in southeastern Siberia (100° – 150°E , 45° – 55°N). (B) Monthly burned area (Mha month^{-1}) in southeastern Siberia for 1997–2016 in each year (gray), mean (thick black),

composite for February to March AO index > 0.5 SD cases (red), and AO < -0.5 SD cases (blue). (C) Mean burned area according to February to March AO index (orange) and 850-hPa geopotential height anomaly over southeastern Siberia (red). Bins on the x axis indicate
