

# Glass frogs reappear in Bolivia after 18 years

January 28 2020

---

The Bolivian Cochran frog is a species of glass frog native to Bolivia and notable for its transparent belly

A rare species of frog native to the eastern slopes of the Bolivian Andes has been spotted in the South American country for the first time in 18

years, the investigation team that made the discovery told AFP.

The Bolivian Cochran [frog](#) is notable for its transparent belly, leading to its nickname, the "glass frog".

"The rediscovery of this species fills us with a ray of hope for the future of the glass frogs—one of the most charismatic amphibians in the world—but also for other species," said [investigation team](#) members Rodrigo Aguayo and Oliver Quinteros, from the Natural History Museum "Alcide d'Orbigny", and Rene Carpio of the San Simon University in Cochabamba.

The team came across the frogs on January 8 during a mission to rescue reptiles and amphibians threatened by a [hydroelectric project](#) in the Carrasco National Park to the east of Cochabamba, the fourth largest city in Bolivia.

Glass frogs are tiny, measuring only 0.7-0.9 inches (19-24 millimeters) and weighing just 2.5-2.8 ounces (70-80 grams). They can be found in the departments of La Paz (west), Cochabamba, Santa Cruz (east) and Chuquisaca (southeast).

Some frogs' hearts and digestive tracts can be seen through their transparent bellies.

Those found in the Carrasco National Park had a transparent belly with a "white chest. The bones and vocal sac of the males are dark green," the team said.

The three frogs found were taken to the K'ayra amphibian conservation center at the Alcide d'Orbigny museum.

Experts will try to encourage the frogs to breed as part of a conservation

strategy.

The K'ayra Center is also home to a pair of Sehuenca water frogs, known as Romeo and Juliet, that scientists have been trying to convince to mate to help preserve their critically endangered [species](#).

Their attempts have so far been in vain.
