

Astronomer discovers that white dwarfs become magnetic as they get older

October 4 2021

Distribution in apparent magnitude (either V or Gaia G magnitude, see Section 5.3) of the WDs of the local 20 pc volume. Red lines refer to the new spectropolarimetric observations obtained in the course of this survey, black lines to the WDs that were observed in spectropolarimetric mode prior to our survey and that we have re-observed with higher precision; blue lines refer to WDs that were observed in previous work and that we have not re-observed. The three small unshaded regions correspond to the three WDs that were not checked for magnetic field. Credit: DOI: 10.1093/mnras/stab2046

At least one 1 in 4 white dwarfs will end its life as a magnetic star. At the end of their life, most stars shrink in size to the dimension of a small planet, an object called a "white dwarf," a late stage of stellar evolution.

In a new scientific paper, Astronomers Dr. Stefano Bagnulo at Armagh Planetarium & Observatory and Professor John Landstreet at the University of Western Ontario revealed that about one white dwarf out of four has a [magnetic field](#).

The astronomers investigated this phenomenon, as it may hold important clues on how stars end their lives. Using telescopes located around the world—in the Canary Islands, Hawaii and in the Atacama desert in Chile—they studied all [white dwarfs](#) (about 150 of them) near our solar system; more precisely, those within 65 [light years](#) (about 620,000,000,000,000 km) of the sun, to obtain this result.

Speaking on this new discovery, Dr. Stefano Bagnulo says: "John Landstreet was part of the team that has discovered the first magnetic field in a white dwarf, more than 50 years ago. It was a privilege for me to carry out this and many other works on white dwarfs with him."

Professor Michael Burton, Director of Armagh Observatory and Planetarium adds: "This is a significant discovery, and I am extremely

proud of the team behind this latest piece of work. Our researchers have long been involved in cutting edge research initiatives that enhances both our organization's and Northern Ireland's reputation, nationally and internationally."

This latest paper, "New insight into the magnetism of degenerate stars from the analysis of a volume limited sample of white dwarfs," published in the *Monthly Notices of the Royal Astronomical Society*,
