

Disabled children still face exclusion in PE. Here's what needs to change

October 14 2021, by Tom Gibbons, Kevin Dixon

Children between the ages of five and 18 should do a minimum of [60 minutes of exercise a day](#) across the week, according to UK government recommendations. And physical education (PE) is, of course, one of the main ways in which both primary and secondary schools meet these guidelines.

As disabled [children](#) are more likely to be [sedentary](#), it's particularly important that they can take part in school exercise. Surveys [have also shown](#) that most disabled children would like to be able to take part in PE more often. Yet our [latest research](#), assisted by recently retired academic and former Paralympic athlete [Dr. Stuart Braye](#), shows that disabled children attending mainstream schools still experience many difficulties in joining in with PE lessons.

At the first world conference on [special needs education](#) held in Spain, in 1994, representatives of 92 countries declared that [inclusive education was the right](#) of all children. It should be the norm in all schools, they said.

Nearly three decades on, however, [personal accounts](#) of social isolation and non-inclusive mainstream education show that school, for many children with disabilities, is anything but inclusive.

Inclusive PE

This is especially true for PE. In 2015, [UNESCO](#) called for all educational establishments to ensure that inclusive, adaptive and safe opportunities to participate in PE be provided for disabled children. Yet despite advances in disability equality legislation both [on a global level](#) and [in the UK](#) specifically, this has long [not been the case](#).

[Research](#) has consistently shown that disabled children experience a less-than-welcoming attitude in mainstream school PE. They don't have access to the right equipment, they feel marginalized and excluded by both non-disabled peers and teachers. Crucially, PE teachers are not adequately trained to support their needs.

Inadequate teacher training

Studies also show that PE teachers feel [under prepared](#) and [ill-equipped](#) to include disabled children in PE lessons. In our [recent study](#), for which we interviewed families of disabled children, PE teachers and [teacher](#) training providers, we found evidence that initial teacher training (ITT) programs are inadequate.

One of the main reasons for this is that the once popular four-year bachelor of [education](#) courses have for many been replaced by one-year ITT courses. As a result, the inclusion of disabled children is only covered superficially.

PE teaching professionals also revealed that ITT provision interprets the term "inclusion" in the broadest possible sense. This means that disability becomes one among many equality issues to be covered as part of a full curriculum.

Our respondents said that the opportunity to work with disabled children during training is essential. Doing a placement within a school that caters to disabled pupils, particularly a special-needs [school](#), would give student teachers the chance to build competence and confidence to develop appropriate inclusion strategies. Instead, our respondents said, many ITT work placements do not introduce trainee teachers to disabled children at all.

More input from disabled people into PE teacher training would also be beneficial. None of the participants in our study had ever heard of a disabled PE teacher. Indeed, [research shows](#) only 0.5% of the teaching workforce reports having disabilities.

Yet none of our study participants could think of any reason why a [disabled person](#) could not complete a PE teacher [training](#) qualification and practice as a PE teacher. Perhaps this is what it would take to ensure [inclusive education](#), and inclusive PE, becomes a reality for all children

with disabilities.
