

# In Egypt's Red Sea, corals fade as oceans warm

October 7 2021, by Bassem Aboualabass

---

Coral reefs, dubbed the "rainforests of the oceans" for their rich biodiversity, are under threat everywhere as rising sea temperatures and acidification cause catastrophic "bleaching" events.

Standing on a boat bobbing gently in the Red Sea, Egyptian diving instructor Mohamed Abdelaziz looks on as tourists snorkel amid the brilliantly coloured corals, a natural wonder now under threat from climate change.

"If they disappear, we'll disappear with them," he says of the vibrant corals on the reef, a species-rich ecosystem just below the turquoise waters that is beloved by diving enthusiasts worldwide.

Coral reefs—often dubbed the "rainforests of the oceans" for their rich biodiversity—are under threat everywhere as rising sea temperatures and acidification cause catastrophic "bleaching" events.

Along with pollution and dynamite fishing, global warming wiped out 14 percent of the world's coral reefs between 2009 and 2018, says a new survey by the Global Coral Reef Monitoring Network, the biggest ever carried out.

Some studies have suggested that many species of coral in the Red Sea—which is also bordered by the Saudi peninsula, Sudan and Eritrea—are unusually heat-resistant, but local professionals say they have already witnessed the damage.

"We can see the effects of global warming before our eyes," said Islam Mohsen, 37, another local diving instructor at the resort town of Sharm El-Sheikh.

"We can see the coral discolouring and turning white."

Tourists snorkel in the Red Sea above a coral reef near Egypt's Red Sea resort city of Sharm El-Sheikh at the southern tip of the Sinai peninsula.

## **Biodiversity hotspots**

Coral reefs cover only a tiny fraction—0.2 percent—of the ocean floor, but they are home to at least a quarter of all marine animals and plants.

The Red Sea and Gulf of Aden boast the most biologically diverse coral reef communities outside of Southeast Asia.

The Red Sea—with just over five percent of the world's coral reefs—is home to 209 types of coral, according to Egypt's environment ministry.

The new global survey said that live hard coral cover in the region fluctuated over recent decades but declined overall, from 36.1 percent in 1997 to 34.3 percent in 2019.

Causes for the degraded reefs varied by location but included tourism activities, coastal development, land runoff and overfishing, the report said.

Steps have been taken in Egypt to protect reefs and marine life that are crucial to the local tourism sector.

In a 2C world, more than 99 percent of all corals would disappear, according to the IPCC.

Egypt's Chamber of Diving and Water Sports—which oversees 269 diving centres and over 2,900 professional divers—has protected fragile areas with buoys to keep boats from mooring.

It has also suspended beginners' diving classes in some areas to allow damaged reefs to recover.

But the largest looming threat, far harder to fix, is global warming.

## Marine heatwaves

Oceans absorb more than 90 percent of the excess heat from greenhouse gas emissions, shielding land surfaces but generating huge, long-lasting marine heatwaves.

These are pushing many species of corals past their limits of tolerance.

"When the temperature of the ocean goes up, it absorbs more carbon dioxide, which creates carbonic acid," said Cairo-based climate change consultant Katherine Jones.

"So not only will the temperature increase, but the PH level will change too," affecting all animals with shells, she said. "We will lose a lot of wildlife, and the ecosystem will be changing in a way that affects us as humans in terms of resources.

The Red Sea is home to some 209 different types of coral reefs, according to Egypt's environment ministry.

Sharm El-Sheikh hosted a United Nations agencies conference in 2018 that called for the protection of coral reefs 'before it's too late'

"The coral reefs are nurseries to baby fish and a feeding ground to bigger fish ... it's an essential part of the ecosystem."

Sharm El-Sheikh hosted a United Nations agencies conference in 2018 that called for the protection of coral reefs "before it's too late".

Egypt also plans to host the Climate Conference of the Parties (COP27) in November next year.

A report by the Intergovernmental Panel on Climate Change has warned that up to 90 percent of coral reefs "may be gone by mid-century" even if the rise in temperatures stabilises below 1.5 degrees Celsius.

Jones warned that, as things stand now, climate change and its impacts can no longer be reversed—only slowed—to prevent the worst consequences.

"Even if humans completely disappear from Earth tomorrow or we stopped producing any kind of emissions," she said, "the temperature will continue to rise by itself."
