

Hideouts, harbours and homes: How vikings may have owed their success to their encampments

For many years, archaeologists and historians have provided an increasingly informed insight into the dynamic world of the vikings, chipping away at the clichés of a crazed, capricious people preoccupied with beards and bloodshed. One particular approach to understanding viking activity has been to study the encampments they set up along the

coasts and rivers of western Europe, allowing them to substitute their ships for a fixed, onshore position whenever cold, fatigue, hunger, or other conditions compelled them to.

Often called "winter camps" or longphuirt, more than 100 of these sites were witnessed across the Atlantic archipelago and European mainland during the ninth century alone, and their tangible remains have been uncovered in places like [Repton](#) and [Torksey](#) in England, and [Woodstown](#) in Ireland. Most recently, potential [viking](#) encampments have also been pointed to near [Zutphen](#) in the Netherlands, as well as the [Coquet Valley](#) in Northumbria.

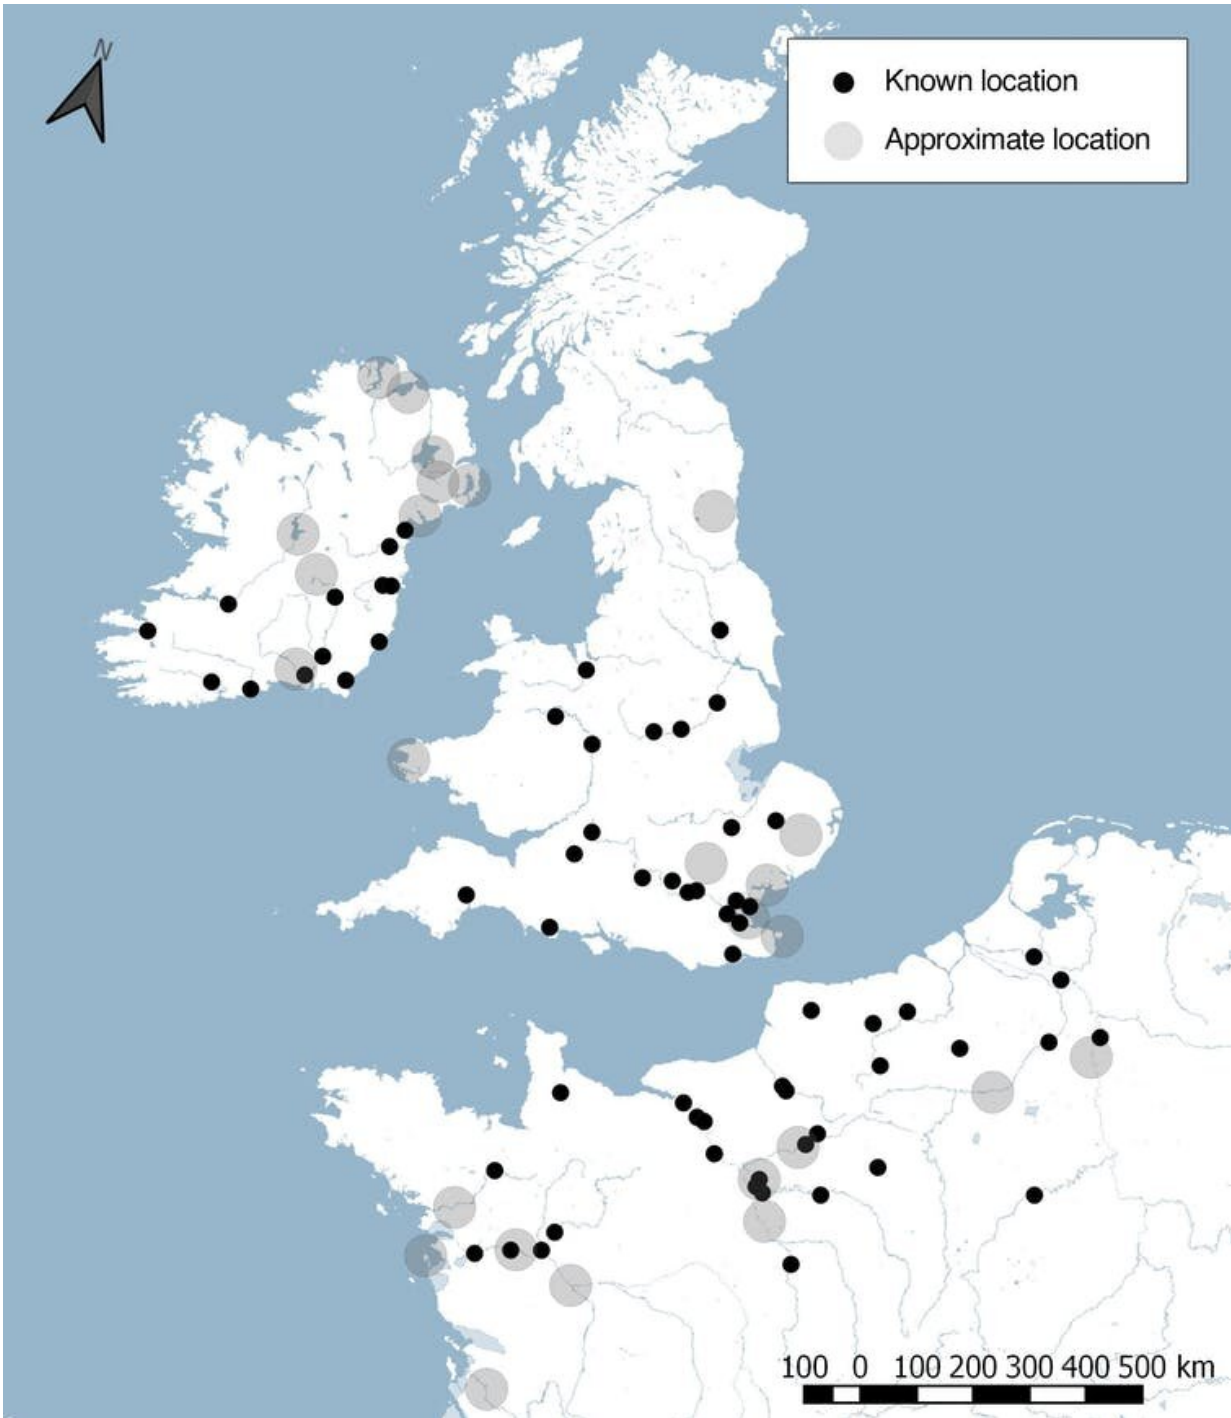

But where these camps have often been considered for their wider strategic roles, much less time has been spent on their everyday, practical planning and operation. [New research](#), tying these different strands of evidence together, now reveals a far more intricate image of [camp](#) logistics, challenging notions of vikings simply waiting out the winter behind their walls in the company of their peers and plunder.

Safe havens

No two viking camps would have been the same, and could have lasted anywhere from just a few hours to many months or even years.

Established in hostile environments, many used islands, wetlands, and other naturally defended positions to their advantage. Others took over prior man-made structures: on the Continent, for example, [the Carolingian palace at Nijmegen](#) was commandeered by vikings in 880, only for its new occupants to set fire to it the following year. Where needed, vikings would also have built their own ramparts, as seen in Repton, where the [abbey church of St. Wystan](#) seems to have been incorporated into a new perimeter wall as a makeshift gatehouse.

But protection from attack would have only been half the battle, as the continued safety of any local food stores, livestock, and non-combatants would have been just as important to the sustainability of any such camp.

Eating local

Like any armed force, viking groups required steady, reliable sources of food and water to keep their encampments viable. Under the looming specter of starvation and malnutrition, they diversified their methods of obtaining provisions as much as possible. As well as hunting, fishing, and foraging around the camps, evidence exists that they raised crops and tended cattle themselves.

Less unexpectedly, vikings also obtained their food through violence—or the threat thereof. Those camped outside Paris in 885-886, for example, were seen carrying off harvests and herds, while others received large amounts of flour, livestock, wine, and cider as part of regional tribute payments.

Back at the camp, this food would have needed to be prepared for consumption and storage. Accordingly, quern-stones—used to grind grain into flour—have been recovered from viking bases in both England and Ireland, and a proposed encampment at Péran in Brittany has produced several iron cauldrons and other cooking vessels. Written records also describe vikings feasting on meat and wine within the confines of their camps.

Hustle and bustle

Beyond the basics of protecting and feeding themselves, vikings engaged in a wide range of camp-bound activities, with shelters, stables, and workshops being built; ships being mended; and weapons, ornaments, and other items being crafted. To support these ongoing efforts, a steady stream of resources—including wood, stone, and (precious) metals—would have had to make its way into the camps.

Venues like these may not have been completely off-limits to outsiders, and may have even provided valuable opportunities to trade. The ninth-century Annals of St Bertin, for example, describe how vikings sought to

"hold a market" on an island in the River Loire (now France). Shortly after, the Annals of Fulda also point to Frankish soldiers setting foot inside a viking camp on the River Meuse (now the Netherlands) – not to fight, but to trade. Physical traces [of such commerce](#)—including coins, silver bullion and trade weights—have been found at sites such as Torksey and Woodstown.

As well as offering vikings yet another way to obtain their supplies, occasions like these may have allowed items that were previously stolen or extorted to be returned to circulation.

Netherlands), thought to indicate an established local viking presence. Credit: National Museum of Antiquities, Leiden

A place for everything

All in all, viking camps were by no means dormant or disorganized, and doubled as command posts, armories, treasuries, granaries, prisons, workshops, markets, harbors, and homes. Hosting diverse and dynamic communities of dozens, hundreds, or at times even thousands of people, some provided support to regional viking groups well beyond the span of a single winter.

To keep camps like these up and running would have been no small feat, relying on levels of planning and discipline not commonly associated with viking activity. As a result, the success of the encampments provides a key insight into a wider viking phenomenon that was neither arbitrary nor aimless as it made landfall across western Europe.
