The California Coastal Commission has approved a plan to poison invasive mice threatening rare seabirds on the Farallon Islands National Wildlife Refuge.

The agency that regulates California's coastline voted 5-3 Thursday night to approve a plan to drop about 3000 pounds (1,360 kilograms) of poisoned bait from helicopters onto the rocky islands off the San Francisco coast that are home to hundreds of thousands of breeding birds.

The move still will require approval from the regional director of the U.S. Fish and Wildlife Service and even then it probably would be at least two years before the program gets underway, officials said.

The Farallon Islands [refuge](#) is home to an estimated 300,000 breeding seabirds, including the rare ash storm-petrel. But officials say the population is threatened by [mice](#) that first arrived on the [islands](#) aboard ships more than a century ago.

In recent years, the mouse population has exploded, attracting burrowing owls that also prey on the ash storm-petrel, officials said.

"This project is necessary and is the right thing to do to stop the ecosystem carnage done by mice: A human-caused problem," Gerry McChesney, manager of the wildlife refuge, said at the meeting.

The proposal has won both support and condemnation from various conservation groups. Critics contend that other [wildlife](#) could be poisoned by the rodenticide.

Famed animal researcher and conservationist Jane Goodall spoke against the proposal at the hearing.

"This poison will inflict pain and suffering on a great many sentient animals," she said.
